

Figure S15: Overgrowth of facultative pathogens during AP. Stacked bar graphs of the mean abundances illustrate the overgrowth of facultative pathogens (*Enterobacteriaceae*, *Escherichia/Shigella*, *Staphylococcaceae*, *Streptococcaceae* and *Enterococcaceae*) from colon, caecum and duodenal samples in C57Bl/6 mice during pancreatitis. These taxa also represent the most prominent taxa in murine and human necrosis samples. Depletion of T_{regs} could not prevent this overgrowth but reduce it.
