Neoskirt height was defined as the distance from the Evolut inflow to the pinned leaflet at the outflow of the S3. For Evolut in Evolut, the neoskirt height was defined as the distance from the Evolut inflow to the fully pinned leaflet height. Neoskirt width is the diameter of the Evolut after the S3 is placed inside.

Neoskirt width of the Evolut in Evolut was determined by the post implant diameter of the Evolut on the CT scan. The pinned leaflet length was defined as the amount of first TAV's leaflet that is pinned.

Mean anatomic measurements with a virtual TAV within an Evolut to determine risk of coronary flow compromise and access. Node level refers to the frame of the index Evolut. LCA and RCA average heights (midpoint) were measured from the index Evolut inflow plane. VTSTJ and VTA were only measured if neoskirt was above the STJ. LCA, left coronary artery; RCA, right coronary artery; VTC, valve-to-coronary distance; VTSTJ, valve-to-sinotubular junction distance; VTA, valve-to-aortic wall at neoskirt plane.
