

File name: Supplementary Data 1

Description: Raw data comparison of Q4PCR and IPDA on the same samples, used for analysis and decay modeling. Measurements where intact HIV DNA was undetectable were set to half of the proviral frequency assuming 1 intact sequence in the number of cells¹ (see blue entries denoted by *). Samples having DNA quality or probe amplification issue by IPDA were excluded from all modeling analyses but included here for completeness (see red entries denoted by #).
