15 **Supplementary Materials and Methods**

16 1. Analysis of extracellular enzyme activity and putative microbial physiological traits

17 Extracellular enzymes related to the degradation of organic carbon (β -1,4-
18 glucosidase [BG], cellobiohydrolase [CBH]), nitrogen (β -1,4-N-acetyl-
19 glucosaminidase [NAG] and L-leucine aminopeptidase [LAP]), and phosphorus (acid
20 phosphatase [AP]) were quantified within 48 h of sample collection by fluorometric
21 methods [1-3]. Briefly, 1 g soil was homogenized with 125 mL acetate buffer (50 mM,
22 pH 5.0) and stirred vigorously for 2 h using a magnetic stir plate. Then, 50 μ L of soil
23 slurry mixed with 100 μ L fluorometric substrate solution (200 μ mol L⁻¹) and 50 μ L
24 acetate buffer were incubated at 25 °C for 4 h, in the dark. The reaction was stopped by
25 adding a 10 μ L aliquot of 1.0 M NaOH. A multifunctional microplate reader was used
26 to measure fluorescence at 365 nm excitation and 450 nm emission wavelengths and
27 expressed in the unit of nmol h⁻¹ g⁻¹ [4].

28 The lengths and angles of enzymatic vectors can be used to illustrate relative
29 microbial resource acquisition strategies [4-5]. Vector length and angle were calculated
30 as:

$$31 V_{length} = SQRT(x^2 + y^2) \quad (1)$$

$$32 V_{angle} (degree) = Degrees (Atan2(x, y)) \quad (2)$$

33 In these functions, x represents the relative activities of C vs. P acquiring enzymes
 34 ($[\text{BG} + \text{CBH}]/[\text{BG} + \text{CBH} + \text{AP}]$) and y represents the relative activities of C vs. N
 35 acquiring enzymes ($[\text{BG} + \text{CBH}]/[\text{BG} + \text{CBH} + \text{NAG} + \text{LAP}]$). SQRT signifies the
 36 square root of the sum of the squared values of x and y, and Atan2 represents the four-
 37 quadrant inverse tangent.

38 2. Calculation of microbial metabolic efficiency

39 Microbial metabolic efficiency can be represented by $q\text{CO}_2$ and CUE, where
 40 higher metabolic efficiency equates to lower $q\text{CO}_2$ and higher CUE [6]. Soil $q\text{CO}_2$
 41 signifies microbial respiration per unit biomass and is expressed in the units of $\text{mg CO}_2\text{-}$
 42 $\text{C mg}^{-1} \text{MBC d}^{-1}$ [7]. According to the biogeochemical equilibrium model, CUE was
 43 indirectly calculated as equations (3-5).

$$44 \quad CUE = CUE_{max} \times \sqrt{\frac{S_{C:N} \times S_{C:P}}{(K_{C:N} + S_{C:N}) \times (K_{C:P} + S_{C:P})}} \quad (3)$$

$$45 \quad S_{C:N} = B_{C:N} / L_{C:N} \times 1 / EEA_{C:N} \quad (4)$$

$$46 \quad S_{C:P} = B_{C:P} / L_{C:P} \times 1 / EEA_{C:P} \quad (5)$$

47 Where $EEA_{C:N}$ and $EEA_{C:P}$ were calculated as $\ln(\text{BG})/\ln(\text{NAG} + \text{LAP})$ and
 48 $\ln(\text{BG})/\ln(\text{AP})$, respectively. $L_{C:X}$ is the molar C:X ratio of labile substrates (e.g., labile
 49 carbon, nitrogen and phosphorus represented by DOC, inorganic N ($\text{NH}_4^+ + \text{NO}_3^-$) and
 50 available P, respectively). $B_{C:X}$ is the molar ratio of microbial biomass carbon, nitrogen

51 and phosphorus. According to thermodynamic constraints of the saturating Michaelis-
52 Menten formulation, CUE_{max} represents the maximum microbial growth efficiency, and
53 was set as 0.60. $K_{C:X}$ was fixed to 0.50 and represents the half-saturation constant [6].
54

75 15 °C (B). SM, no added viruses; DV, added-inactive viruses; V, added-active viruses

76 with no dilution; 2^{-1} V, added-active viruses with 2-fold dilution; 10^{-1} V, added-active
77 viruses with 10-fold dilution; 25 and 15 signify temperature (25°C and 15°C) during
78 the incubation.
79

80

81 **Figure S2.** Cumulative CO₂ emission (mean ±std dev) for incubations at three time

82 points of 7 d (A, B), 28 d (C, D) and 98 d (E, F). SM, no added viruses; DV, added-

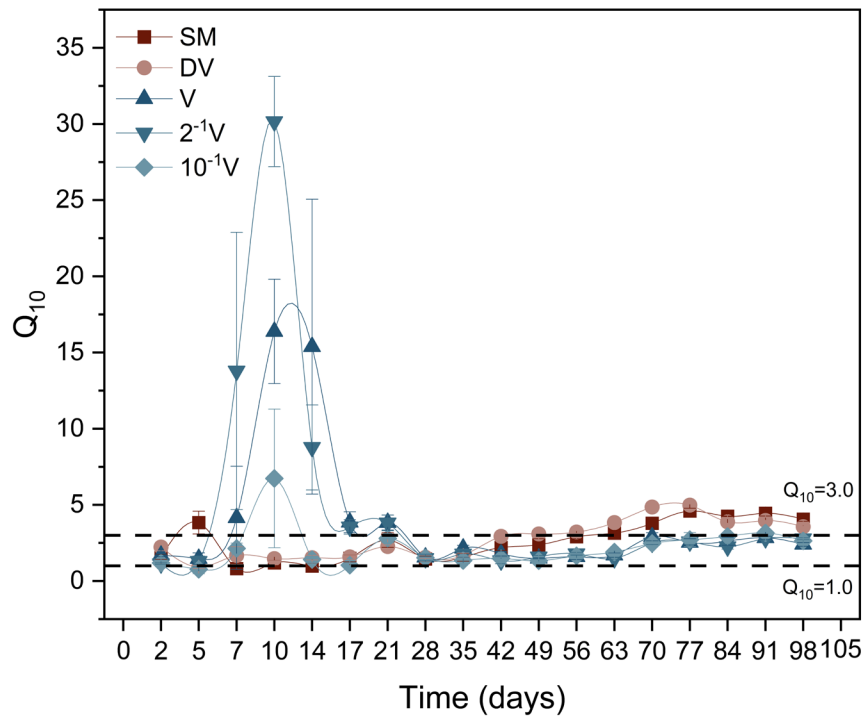

83 inactive viruses; V, added-active viruses with no dilution; 2⁻¹ V, added-active viruses

84 with 2-fold dilution; 10⁻¹ V, added-active viruses with 10-fold dilution; 25 and 15

85 signify temperature (25°C and 15°C) during the incubation. Different lowercase letters

86 represent significant differences at $p < 0.05$.

87

88

89 **Figure S3.** Calculation of Q_{10} (mean \pm std dev) at different groups. SM, no added viruses;

90 DV, added-inactive viruses; V, added-active viruses with no dilution; 2^{-1} V, added-active

91 viruses with 2-fold dilution; 10^{-1} V, added-active viruses with 10-fold dilution.

92

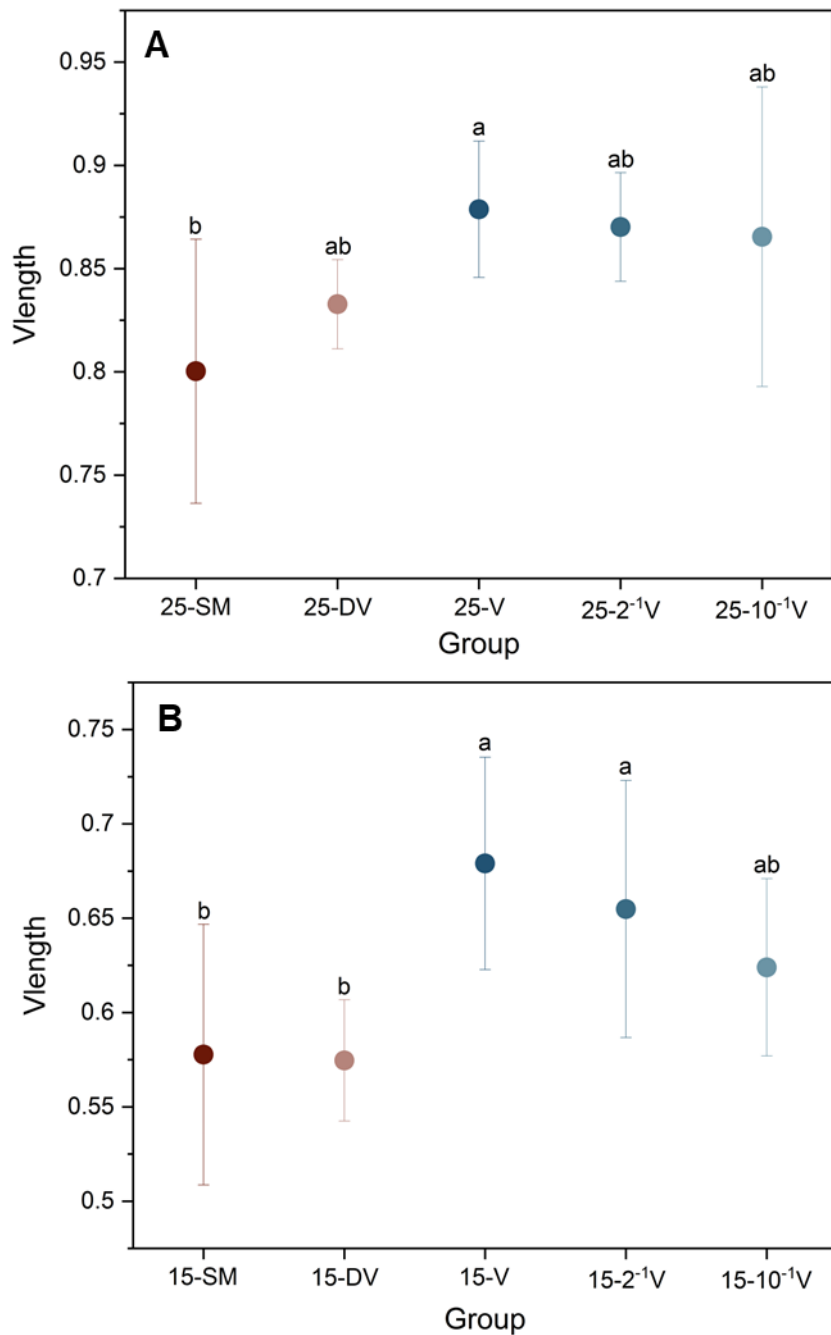

93

94 **Figure S4.** Metabolic quotient (mean \pm std dev; qCO_2 , respiration per unit microbial

95 biomass, $mg\ CO_2-C\ mg^{-1}\ MBC\ d^{-1}$). SM, no added viruses; DV, added-inactive viruses;

96 V, added-active viruses with no dilution; 2^{-1} V, added-active viruses with 2-fold dilution;
97 10^{-1} V, added-active viruses with 10-fold dilution; 25 and 15 signify the temperature
98 (25 °C and 15 °C) during the incubation. Different lowercase letters represent
99 significant differences at $p < 0.05$.

100

101

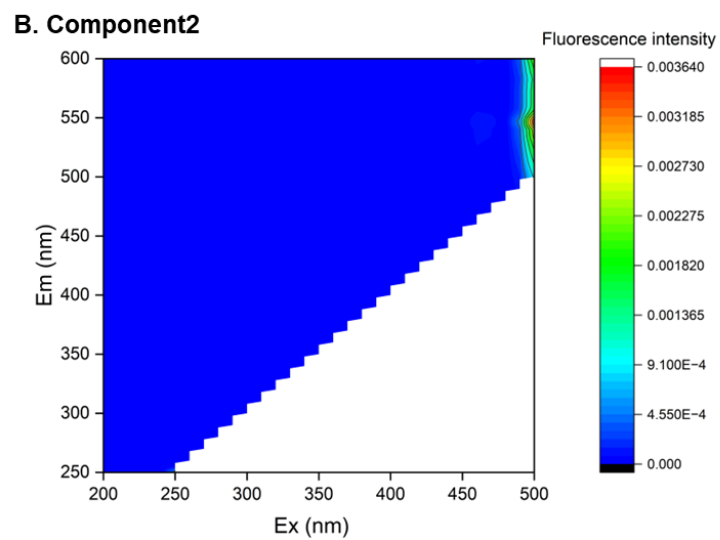

102 **Figure S5.** Microbial resource acquisition strategy (mean \pm std dev). The Length

103 quantified the relative C vs. nutrient (N and P)-acquiring enzyme activities. A lower

104 Length indicates relatively higher nutrient acquisition strategies (relative to C). SM, no

105 added viruses; DV, added-inactive viruses; V, added-active viruses with no dilution; 2⁻¹

106 ¹ V, added-active viruses with 2-fold dilution; 10⁻¹ V, added-active viruses with 10-fold
107 dilution; 25 and 15 signify the temperature (25 °C and 15 °C) during the incubation.
108 Different lowercase letters represent significant differences at $p < 0.05$.
109

110

111 **Figure S6.** Excitation-emission matrix (A, B, C) of DOM for three fluorescent

112 components (Component 1: humic-like components [8-9]; Component 2: quinone-like
113 components [10]; Component 3: protein-like component [11]) identified by EEM-
114 PARAFAC analysis.
115

116

117 **Figure S7.** Hydrophobicity of DOM after incubation (mean ±std dev) as determined by

118 SUV260. SM, no added viruses; DV, added-inactive viruses; V, added-active viruses

119 with no dilution; 2^{-1} V, added-active viruses with 2-fold dilution; 10^{-1} V, added-active
120 viruses with 10-fold dilution; 25 and 15 signify the temperature (25 °C and 15 °C)
121 during the incubation. Different lowercase letters represent significant differences at p
122 < 0.05.
123

124

125 **Figure S8.** Correlation heatmap between microbial resource acquisition traits and

126 optical properties of DOM. Cumulation, cumulative CO₂ emission; qCO₂, metabolic

127 quotient, CUE, carbon use efficiency; CO₂, the CO₂ emission rate; HIX, aromaticity

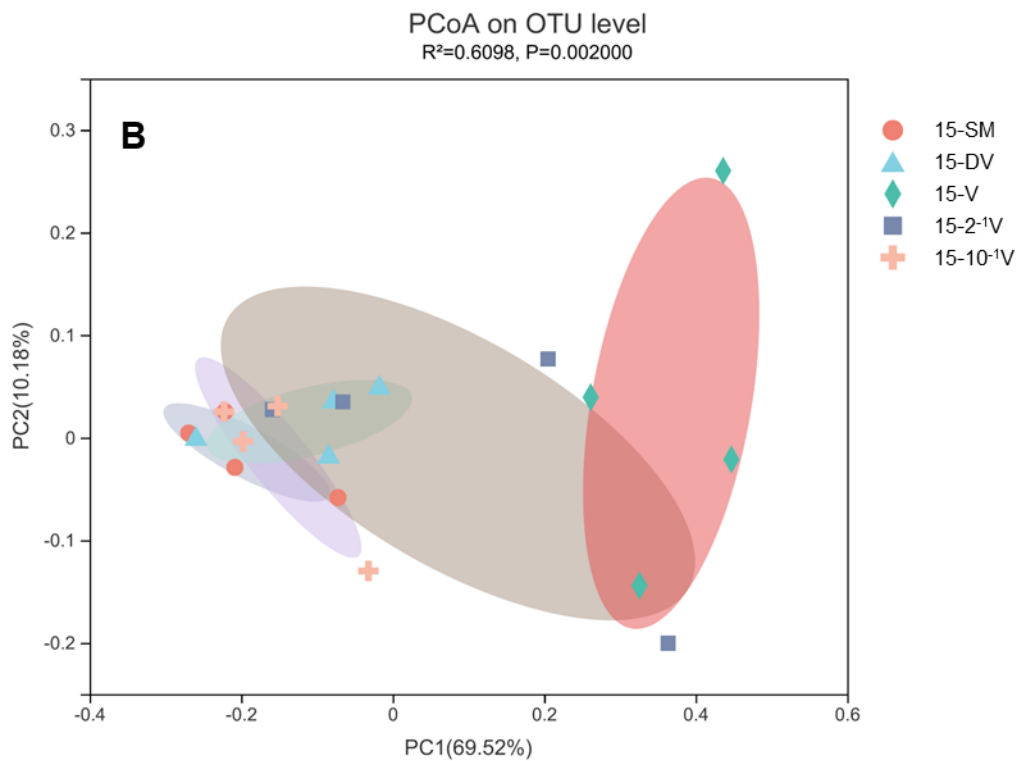

128 degree of DOM; C1 (humic-like), C2 (quinone-like), and C3 (protein-like), different

129 3D-fluorescence components of DOM; SUV254, represents the humification of DOM;

130 SUV260, represents the hydrophobicity of DOM; Length, relative C:nutrient acquiring

131 ratio; Angle, relative P:N-acquiring ratio.

132

133

134 **Figure S9.** Principal coordinates analysis (PCoA) of bacterial communities in different

135 groups at incubation temperatures of 25 °C (A) and 15 °C (B).

136

137

138 **Figure S10.** Redundancy analysis (RDA) at OTU level demonstrating the effect of soil
 139 physicochemical properties on bacterial communities for different groups. NO₃, soil
 140 nitrate-N; NH₄, soil ammonium-N; AP, available phosphorus; SOC, soil organic carbon;
 141 TN, total nitrogen; DOC, dissolved organic carbon; DON, dissolved organic
 142 nitrogen; N/P, the mass ratio of total nitrogen and total phosphorus; C/P, the mass ratio
 143 of soil organic carbon and total phosphorus; C/N, the mass ratio of soil organic carbon
 144 and total nitrogen; AP/MBC represents normalized enzyme activities of acid
 145 phosphatase as units/mg MBC; Ecoenzymatic vector length (length, relative C:nutrient
 146 acquiring ratio) and angle (angle, relative P:N-acquiring ratio); HIX, aromaticity degree
 147 of DOM; C1 (humic-like), C3 (protein-like), different 3D-fluorescence components of

148 DOM; MD, relative molecular mass of DOM; SUV260, hydrophobicity of DOM; MBC,
149 microbial biomass carbon; MBP, microbial biomass phosphorus. * $p < 0.05$; ** $p < 0.01$.
