¹Notation indicates carbon chain length followed by number of double bonds. Positional isomers for C14:1, C16:1, and C18:1 FA species are indicated by “a”, “b”, and “c”.

²Each replicate is comprised of homogenate from 5 flies.

³Raw abundance counts are normalized to the abundance of a spiked standard (pentadecanoic acid).

Supplemental Table 8. Fatty acid (FA) analysis of male testes from control and antifungal (AF)-treated males for each replicate.
