A Novel Serum-Based Diagnosis of Alzheimer's Disease Using an Advanced Phage-Based Biochip

Maria Giovanna Rizzo, Laura Maria De Plano, Nicoletta Palermo, Domenico Franco, Marco Nicolò, Emanuele Luigi Sciuto, Giovanna Calabrese, Salvatore Oddo, Sabrina Conoci* and Salvatore P. P. Guglielmino*

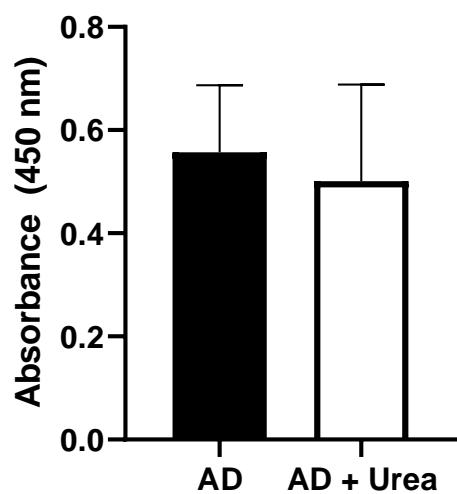

Figure S1. ELISA results for binding affinity of phage 12III1 to the IgG A β autoantibodies.

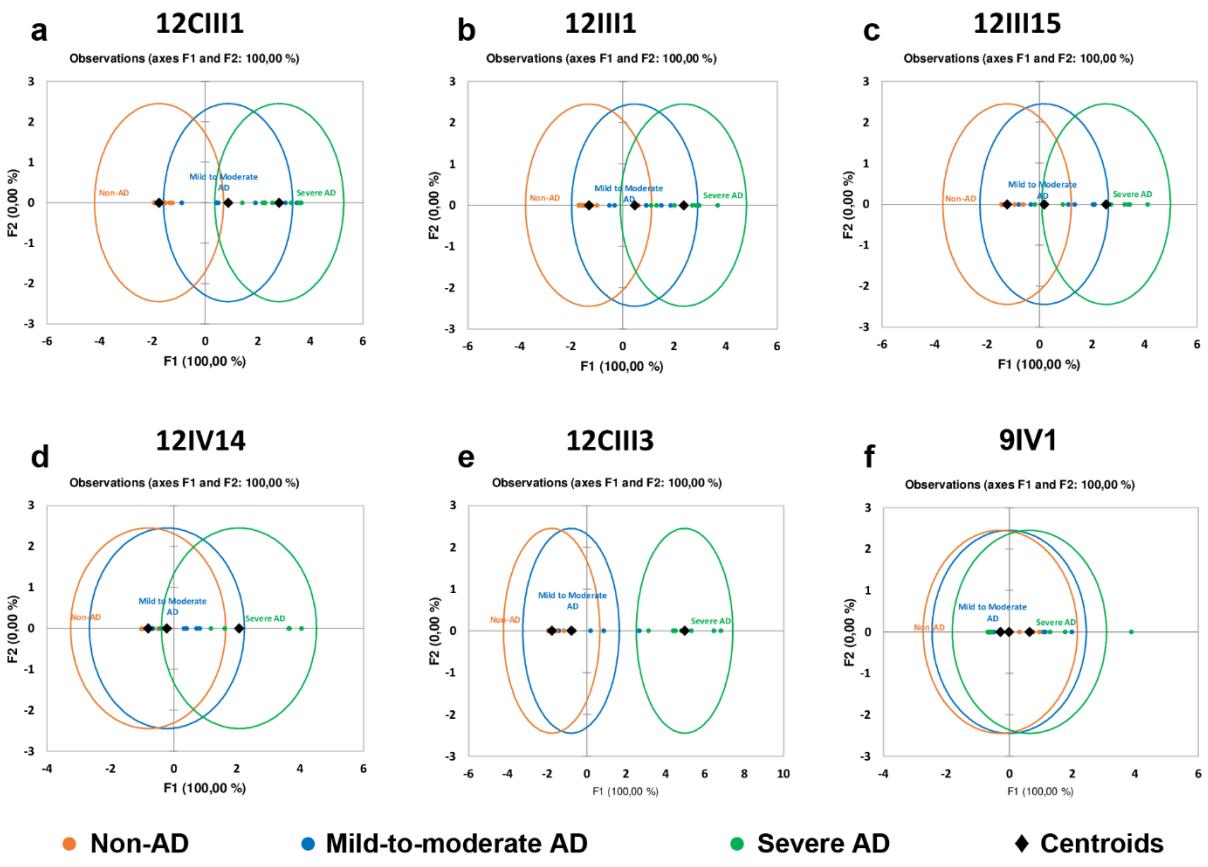

Figure S2. Discriminant analysis plot on a 1-dimensional map of sera by using a single phage clone. Orange, blue and green filled circles indicate sera identified as Non-AD, Mild-to-Moderate AD and Severe AD, respectively. The number and percentage of the sera correctly discriminated are summarized in the confusion matrix of Table 3. n=18 for Non-AD, 10 for Mild-to-Moderate AD and 8 for Severe AD.

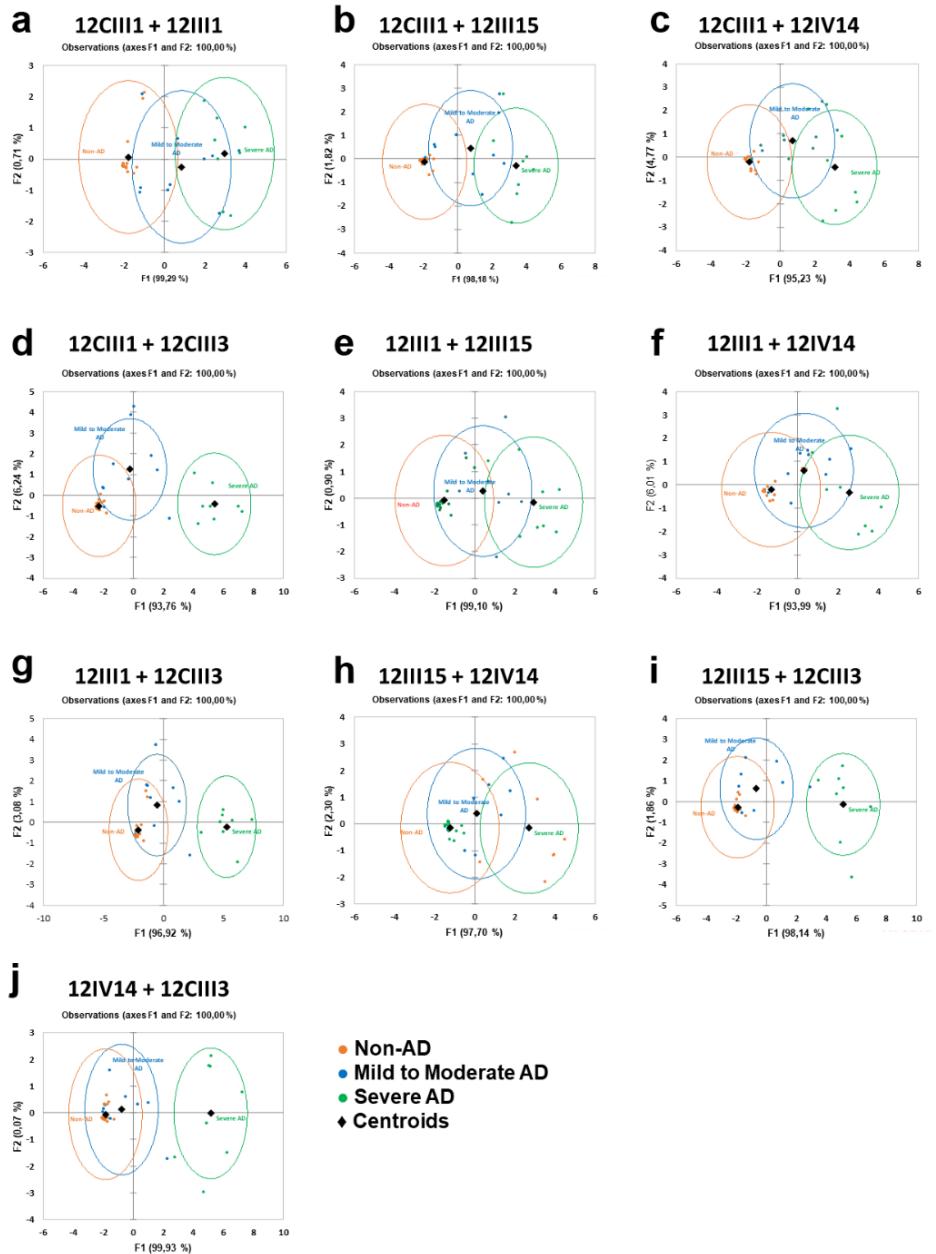

Figure S3. Discriminant analysis plot on a 2-dimensional map of 36 sera by using pairs of phage clones. Orange, blue and green filled circles indicate sera identified as Non-AD, Mild-to-Moderate AD and Severe AD, respectively. The number and percentage of the sera correctly discriminated are summarized in the confusion matrix of Table 4. n=18 for Non-AD, 10 for Mild-to-Moderate AD and 8 for Severe AD

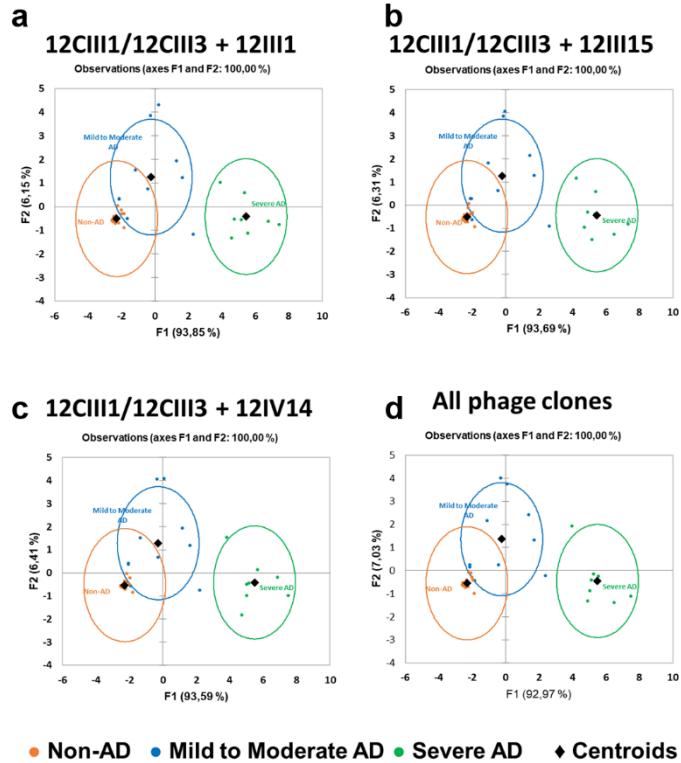

Figure S4. Discriminant analysis plot on a 2-dimensional map of 36 sera by using three or more clones. (a-c) The panels indicate the analyses done with the pair 12CIII1/12CIII3 and a third phage clone. (d) The panel indicates the analysis done including all phages. Orange, blue and green filled circles indicate sera identified as Non-AD, Mild-to-Moderate AD and Severe AD, respectively. The number and percentage of the sera correctly discriminated are summarized in the confusion matrix of Tables 5-6. n=18 for Non-AD, 10 for Mild-to-Moderate AD and 8 for Severe AD.

Table S1. Homology prediction by Pepsurf analysis between 3D Amyloid- β structures and phage peptides. The table shows on the top the amino acid primary sequence of Amyloid- β , and in the following rows the position of residues and chains mimicked by phage-peptide (green square).

Table S2. Demographic characterization of sera

Clinical Group	Average age	Average MMSE	Sex
Non-AD	69	30	55,5 % M
Mild-to-Moderate	75	19	73 % M
Severe	75	9	25 % M

Table S3. Factor scores for clone 12CIII1. Probability of belonging to Non-AD, Mild-to-Moderate AD, Severe AD groups, and the squared Mahalanobis distances to the centroid of the group of tested 36 sera by using 12CIII1 phage clone. Incorrectly discriminated sera are in bold.
