Study author(s) / year published	Country	Key words	Study aims
Allen et al. (2019) [24] A road map for translational research on artificial intelligence in medical imaging	United States	NA	Summarizes key priorities for translational research developed at the National Institutes of Health/RSNA/ACR/The Academy Workshop to create a road map to grow an ecosystem of will allow robust collaborations between practicing clinicians and AI researchers to advance foundational and translational research.
Amann et al. (2020) [13] Explainability for artificial intelligence in healthcare: a multidisciplinary perspective	Switzerland	Artificial intelligence, Machine learning, Explainability, Interpretability, Clinical decision support	Assess the role of explainability in medical AI and ethically evaluate what explainability means for the adoption of AI-driven tools into clinical practice.
Baig et al. (2020) [34] Urgent need for developing a framework for the governance of ai in healthcare	Saudi Arabia	Healthcare AI, Data science, Ethics, Governance	Discuss the urgent need to institute a robust governance and compliance framework to ensure the efficacy, safety, privacy, and ethical considerations of the application and integration of AI in the healthcare domain.
Loi et al. (2020) [37] Transparency as design publicity: explaining and justifying inscrutable algorithms	Switzerland	Machine learning, Transparency, Explanations, Justifications, Philosophy of science, Computing methodologies~ Artificial intelligence, Cognitive science, Machine learning, Human-centered computing~ HCI theory, Concepts and models	Argue that transparency of machine learning algorithms, just as explanation, can be defined at different levels of abstraction and propose "design publicity," an approach that explains and provides evidence for algorithms as an intentional product in a given domain, as a new form of algorithmic transparency.
Grote et al. (2021) [21] How competitors become collaborators— Bridging the gap(s) between machine learning algorithms and clinicians	Germany	Clinical expertise, Defensive medicine, human–computer interaction, Machine learning, Medical diagnosis	Evaluate different epistemic and normative factors that may lead to algorithmic overreliance within clinical decision-making and argue that there is an intriguing dialectic in the collaboration between clinicians and ML algorithms.
Ho et al. (2021) [31] Ensuring trustworthy use of artificial intelligence and big data analytics in health insurance	China/United States/Singapo re	NA	Discuss what a robust ethical and regulatory environment might look like for big data analytics in health insurance and describe examples of safeguards and participatory mechanisms that should be established.
Ho et al. (2019) [32] Governance of automated image analysis and artificial intelligence analytics in healthcare	Singapore	NA	Discuss the nature of AI governance in biomedicine, as well as its limitations, and argue that radiologists must assume a more active role in propelling medicine into the digital age.
Kerasidou (2021) [33] Ethics of artificial intelligence in global health: Explainability, algorithmic bias and trust	UK	Artificial intelligence, Global health, Lower-middle-income- countries (LMICS), Explainability, Algorithmic bias, Trust	Argue that the pathway to fair, appropriate, and relevant AI necessitates the development and successful implementation of national and international rules and regulations that define parameters and set boundaries of operation and engagement.
Landau et al. (2022) [29] Developing machine learning-based models to help identify child abuse	United States	Child abuse and neglect, Phenomenological ethics, Machine learning–based risk models, Pediatric emergency	Discuss and provide recommendations for key ethical issues related to machine learning-based risk models development and evaluation, as well as identify several areas for further policy and research.

and neglect: key ethical		departments, Electronic health	
challenges and		record	
recommended solutions			
Liaw et al. (2020) [23]	Australia/UK/ Canada/Unite	Ethics, clinical; Data accuracy; Information systems; Medical	Using a literature review and Delphi exercises, identified practical recommendations for the curation of
Ethical use of electronic health record data and artificial intelligence: recommendations of the primary care informatics working group of the international medical informatics association	d States	record systems, computerized; Artificial intelligence	routinely collected health data and artificial intelligence in primary care with a focus on ensuring their ethical use.
Makridis et al. (2021)	United States	Artificial intelligence; Ethics;	Explored newly developed principles around
[38]	United States	Veterans; Health data; Technology; Veterans affairs;	trustworthy AI and evaluated their relevance for application at scale to vulnerable groups that are
Ethical applications of artificial intelligence: evidence from health		Health technology; Data	potentially less likely to benefit from technological advances.
research on veterans	1112	A / · C · · 1 · / 11 · A 1· / ·	
Mökander et al. (2021) [28] Ethics-based auditing of	UK	Artificial intelligence, Auditing, Automated decision-making, Ethics, Governance	Discuss the feasibility and efficacy of ethics-based auditing (EBA) as a governance mechanism by providing a theoretical explanation of how EBA can contribute to good governance, propose criteria for how
automated decision- making systems: nature, scope, and limitations			to design and implement EBA, and identifying the conceptual, social, economic, organizational, and institutional constraints with EBA.
Morley et al. (2020) [22]	UK	Artificial intelligence, Applied	Reviewed and presented research on publicly available
		ethics, Data governance, Digital	AI ethics tools to contribute to closing the gap between
From what to how: an		ethics, Governance, Ethics of AI,	principles and practices by constructing a typology that
initial review of publicly available ai ethics tools,		Machine learning	may help developers apply ethics at each stage of the ML development pipeline, and to signal to researchers
methods and research to translate principles into			where further work is needed.
practices			
Ploug et al. (2020) [36]	Denmark/UK/	AI diagnostics, Contestability,	Suggest that explainability should be explicated as
	Norway	Explainability, Health data, Bias,	'effective contestability' and, taking a patient-centric
The four dimensions of contestable AI		Performance, Organization of diagnostic labor	approach, argue that patients should be able to contest the diagnoses of AI diagnostic systems through the
diagnostics - A patient-			availability of information regarding the AI system's
centric approach to			use of data, the system's potential biases, the system
explainable AI			performance, and the division of labor between the
Reddy et al. (2020) [25]	Australia	Artificial intelligence,	system and health care professionals. Propose a governance model that aims to not only
		Healthcare, Ethics, Regulation,	address the ethical and regulatory issues that arise out
A governance model for the application of AI in		governance Gramework	of the application of AI in health care, but also stimulate further discussion about governance of AI in
healthcare			health care.
Roski et al. (2020) [39]	United States	Artificial intelligence/Ethics,	Highlight recently published literature on AI risks and
Enhancing trust in AI		Artificial intelligence/Organization and	mitigation strategies that would be relevant to designing, implementing, and promoting self-
through industry self-		administration, Certification,	governance, as well as describe a process for how a
governance		Accreditation, Policymaking	diverse group of stakeholders could develop and define standards for promoting trust and AI risk-mitigating practices through greater industry self-governance.
Samuel et al. (2020) [26]	England	NA	Propose a process of ethics governance for population health research in higher education institutions that
Defining ethical			takes the form of review after the research has been
standards for the			completed, with particular focus on the role artificial
application of digital tools to population health			intelligence algorithms play in augmenting decision- making.
research			·········

Stix (2021) [40] Actionable principles for artificial intelligence policy: three pathways	Netherlands	Artificial intelligence policy, Actionable principles, Ethics, Ethics of artificial intelligence, Governance of artificial intelligence	Propose a novel framework for the development of 'Actionable Principles for AI' that acknowledges the relevance of AI Ethics Principles and methodological elements to increase their practical implementation in policy processes and includes a case study using elements extracted from the Ethics Guidelines for Trustworthy AI.
Wiens et al. (2019) [35] Do no harm: a roadmap for responsible machine learning for health care	United States	NA	Present a framework, context, and guidelines for accelerating the translation of machine-learning-based interventions in health care, highlighting that successful translation will require a team of engaged stakeholders and a systematic process from beginning (problem formulation) to end (widespread deployment).
Yoon et al. (2021) [27] Machine learning in medicine: should the pursuit of enhanced interpretability be abandoned?	UK/United States	NA	Argue why interpretability should have primacy alongside empiricism, and detail reasonings for the importance of interpretability, such as the establishment of trust and professional and public acceptance.
Zhao et al. (2021) [30] Ethics, integrity, and retributions of digital detection surveillance systems for infectious diseases: systematic literature review	China	Artificial intelligence, Electronic medical records, Ethics, Infectious diseases, Machine learning	Conducted a systematic review to investigate ethical issues identified from utilizing artificial intelligence- augmented surveillance or early warning systems to monitor and detect common or novel infectious disease outbreaks to inform necessary ethical considerations for medical practitioners and policymakers and global governance structures.
