Figure S1: Cab45 does not regulate the basolateral secretion of Wnt3a

(A) MDCK PLAP-sec cultured on coverslip were considered to reveal intracellular PLAP-sec localization and endoplasmic reticulum (ER) (KDEL sequence). Scale bar 10 μ m . (B, C, D) MDCK Wnt3a CTRLi or Cab45i plated on coverslip were proceed for immunofluorescence to reveal Cab45 (B) or Wnt3a and ER marker (C). **submission** AP and BL media of MDCK Wnt3a CTRLi or Cab45i plated on filters for 4 days were collected to monitor Wnt3a secretion. On the right quantification of AP and BL Wnt3a secretion normalized to intracellular tubulin levels. Experiments were performed 3 different times. (NS) not significant.
