

Fig. S1. Characterization of iPS-RPE cells. (A) Representative images of mature iPSRPE cells under phase contrast and immunostained with ZO1 (green) and RPE65 (red). Nuclei are labeled with DAPI (blue). **(B)** Transepithelial electrical resistance (TEER) of mature iPS-RPE cells grown on transwells. **(C)** Gene expression of mature RPE markers in iPS-RPE cells cultured for 4 weeks compared to ARPE-19 from n=3 replicates per cell line. Graphs represent mean values ± SEM. ***p < 0.001, ****p < 0.0001.

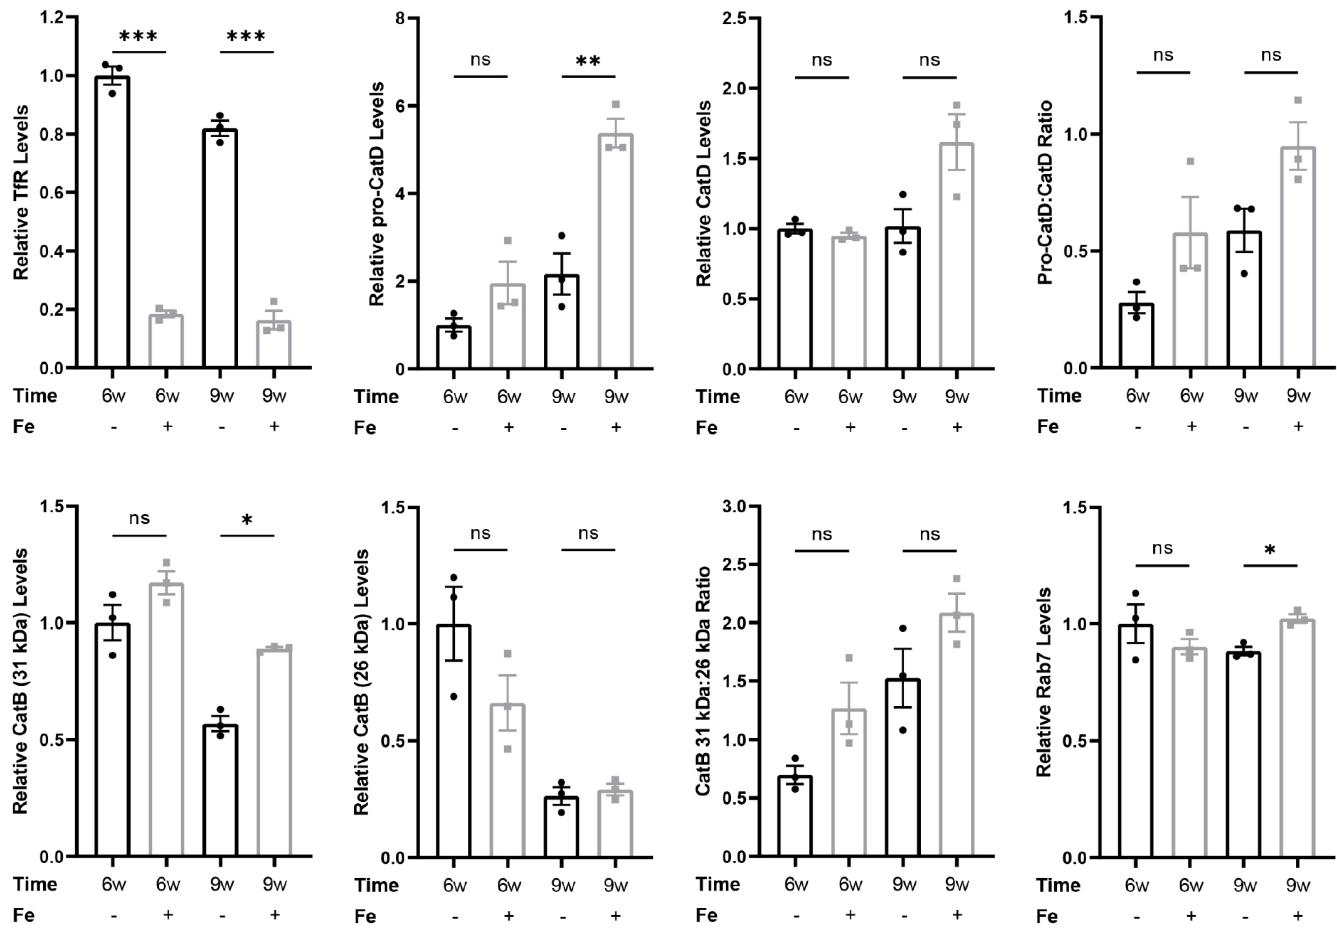

Fig. S2. Quantification of Western blots in iron-loaded iPS-RPE. Western blot images are shown in Fig. 1A. Graphs represent mean values \pm SEM. * $p < 0.05$, ** $p < 0.01$, *** $p < 0.001$.

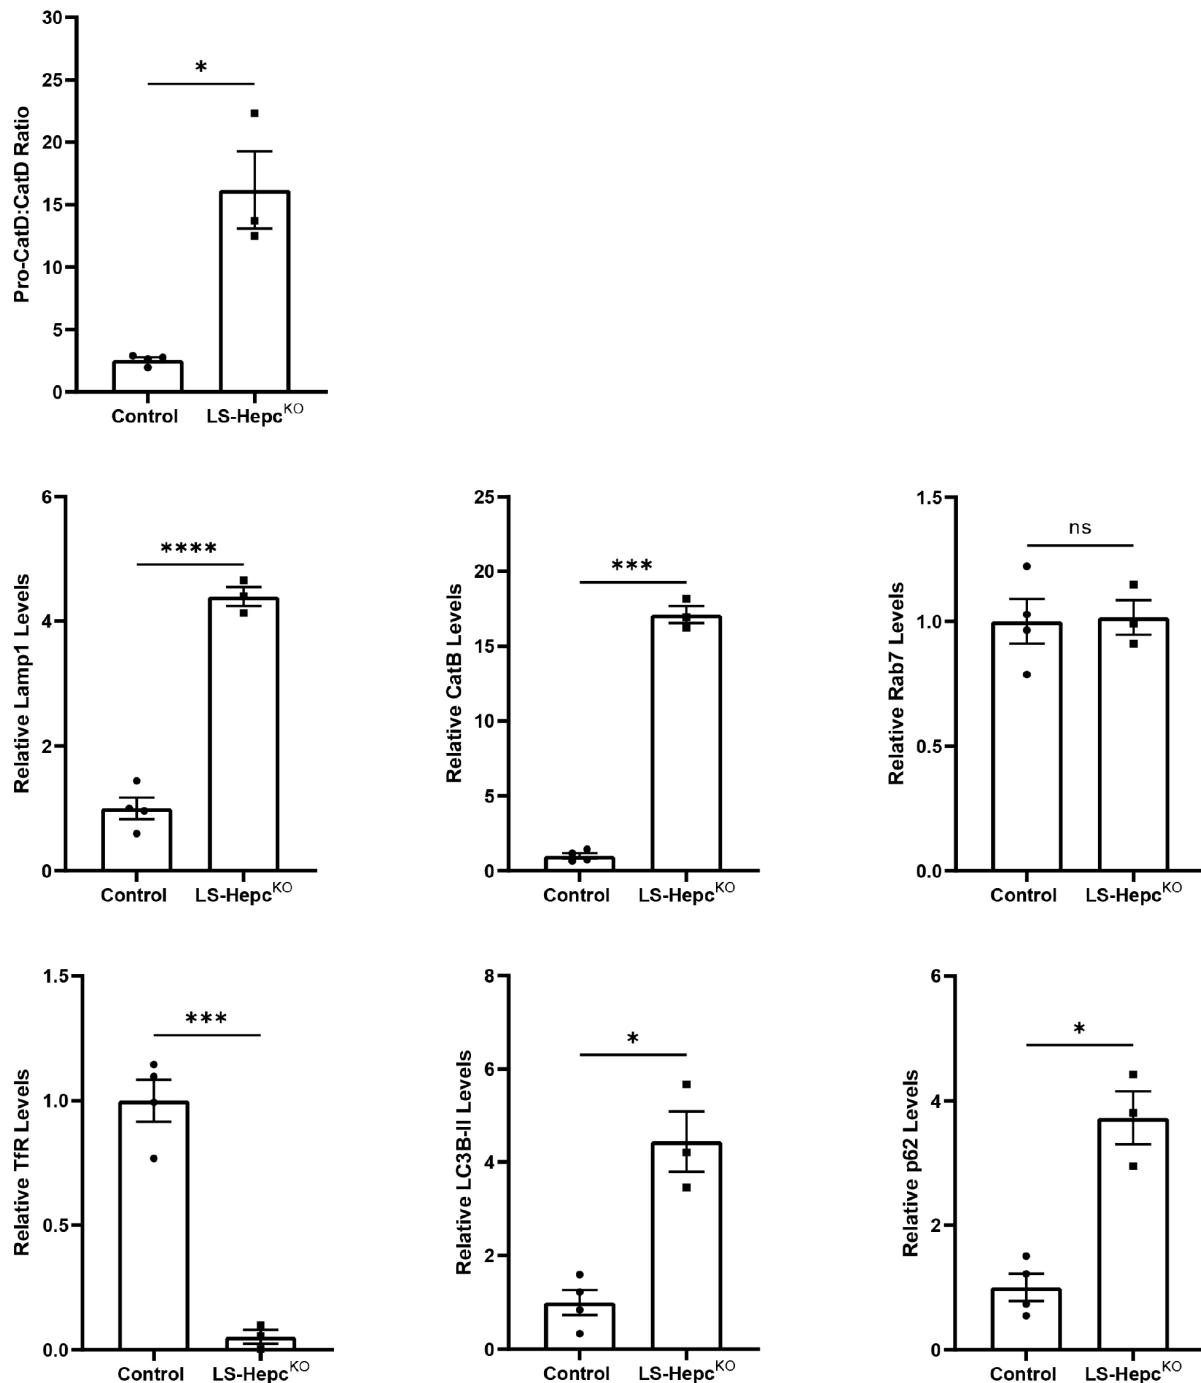

Fig. S3. Quantification of Western blots in 12-month LS-Hepc^{KO} mice.
 Western blot images are shown in Fig. 20. Graphs represent mean values ± SEM.
 *p < 0.05, ***p < 0.001, ****p < 0.0001. Control mice had genotype AlbCre-, Hepc^{f/f}.

Fig. S4. Additional proteomics enrichment analysis on LS-Hepc^{KO} RPE. Enrichment analysis with the ToppGene Suite on 12-month LS-Hepc^{KO} vs control (AlbCre⁻, Hepc^{f/f}) RPE for **(A)** human phenotype and **(B)** disease association. Disease associations in B are sourced from the DisGeNET BeFree system.
