

Supplementary Figure 8.

Supplementary Figure 8. Gene expression level of Krüppel-like factor (KLF) family among the five mCRPC subtypes.

Boxplots representing the gene expression level of KLF family transcription factors enriched in AR-/NE- tumors compared to other mCRPC subtypes. Boxplots should be interpreted as follows: horizontal lines denote median values; boxes extend from the 25th to the 75th percentile of each group's distribution of values; vertical extending lines denote adjacent values (the most extreme values within 1.5 interquartile range of the 25th and 75th percentile of each group). Pair comparisons between groups were assessed by the Student's T-test and adjusted for multiple testing (FDR). Significance is indicated as follows: ns not significant; * $p \leq 0.05$; ** $p \leq 0.01$; *** $p \leq 0.001$; **** $p \leq 0.001$.
