

## Supplementary figure S4.

*Supplementary figure S4. Comparison between fHR scores from chemo-naïve samples obtained from different anatomical locations of individual patients. With the proposed cut-off of 10 (indicated as dashed line), fHR status of each patient remained unchanged regardless of anatomical site sampled. If a patient has an fHR score near the cut-off value, one might consider assaying other tumor sites, if feasible, in order to increase the confidence of fHR classification. Abbreviations: Ova, ovary; Adn, adnexa; Tub, fallopian tube; Per, peritoneum; Ome, omentum.*
