

Supplementary Figure 4. Muscle biopsies from all myositis groups express high levels of the most overexpressed genes in IMNM. RNA expression levels ($\log_2[\text{FPKM} + 1]$) of the 10 most upregulated genes in IMNM in all of the muscle biopsy groups. NT: normal tissue; DM: dermatomyositis; AS: antisynthetase syndrome; IBM: inclusion body myositis; IBM: inclusion body myositis.
