

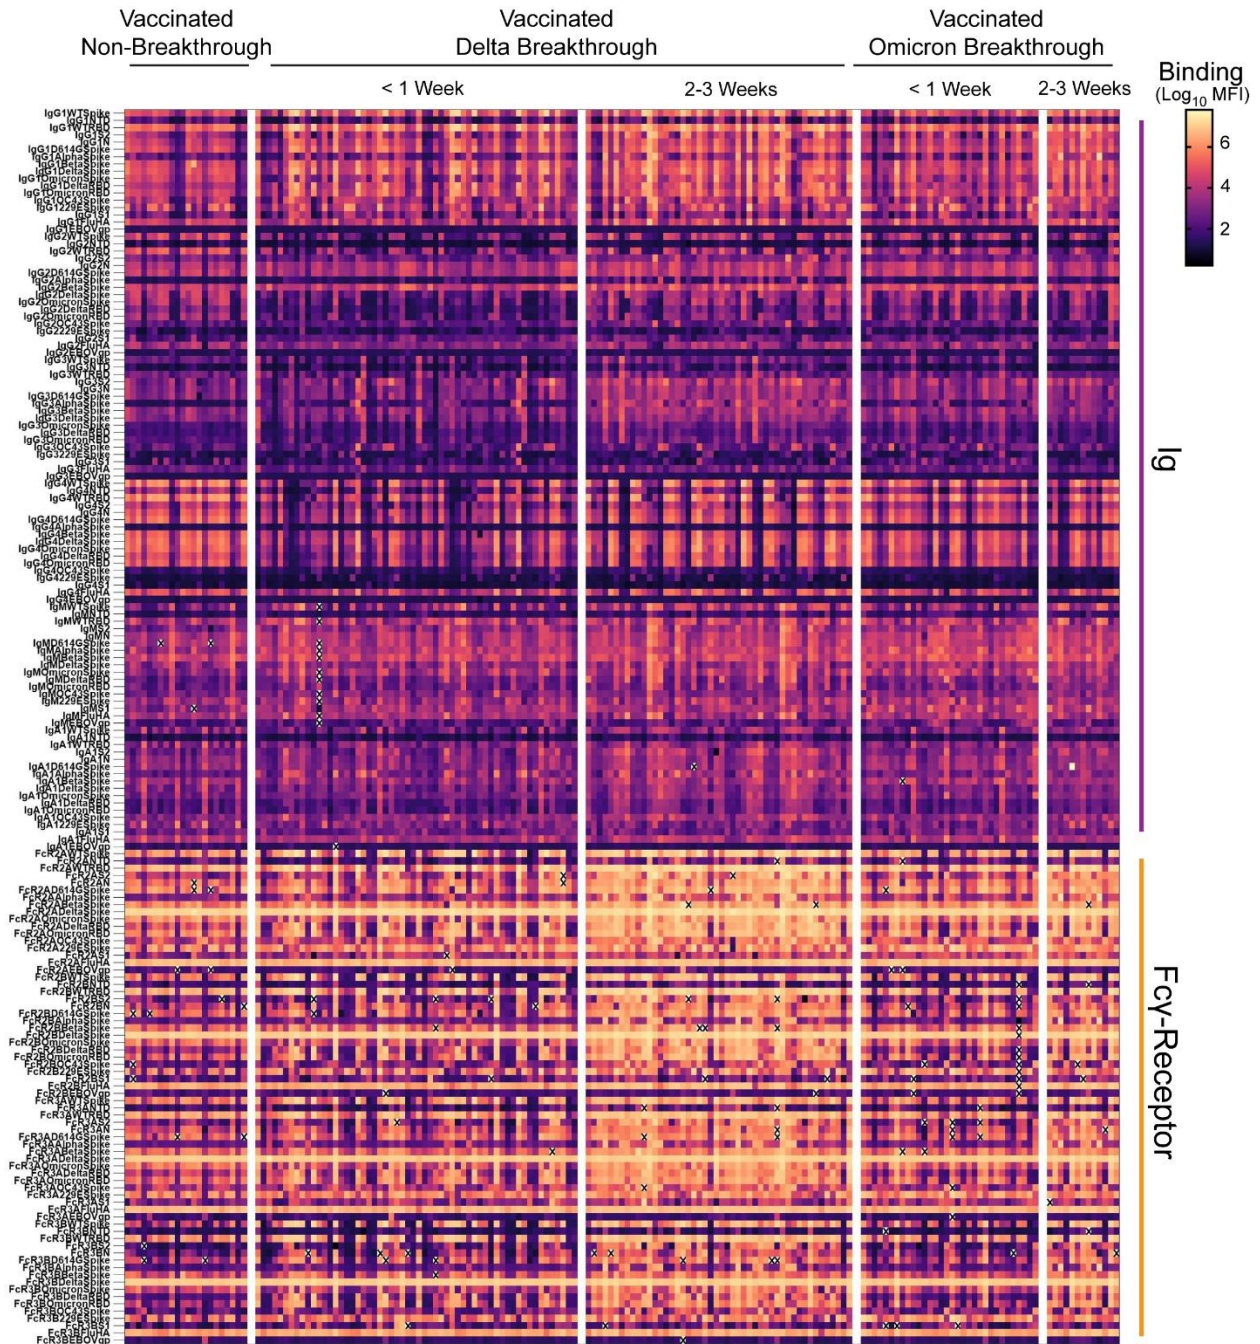

Figure S1

Supplementary Figure 1. Antibody binding array of SARS-CoV-2 and control antigens. Sera taken from non-infected, vaccinated individuals (left) and breakthrough Delta and Omicron VOCs infections were assayed for binding to various SARS-CoV-2 and control antigens. Breakthrough cases had two timepoints collected: < 1 Week post-confirmed breakthrough and 2-3 Weeks post-infection. Both Ig and FcγR-binding antibodies were quantified for antigen binding. The heatmap legend for overall binding is shown on the right.
