

# Supplementary Data

**Title:** Identification of two distinct phylogenomic lineages and model strains for the understudied cystic fibrosis lung pathogen *Burkholderia multivorans*

**Authors:** Kasia M. Parfitt<sup>1</sup>, Angharad E. Green<sup>2,3</sup>, Thomas R. Connor<sup>1</sup>, Daniel R. Neill<sup>2</sup>, and Eshwar Mahenthiralingam<sup>1</sup>

**Affiliations:**

<sup>1</sup> Cardiff University, Microbiomes, Microbes and Informatics Group, Organisms and Environment Division, School of Biosciences, Cardiff University, CF10 3AX, UK

<sup>2</sup> Department of Clinical Infection, Microbiology and Immunology, Institute of Infection, Veterinary and Ecological Sciences, University of Liverpool, Liverpool, L69 7BE, UK

**Current affiliations:**

<sup>3</sup> Big Data Institute, Nuffield Department of Population Health, Li Ka Shing Centre for Health Information and Discovery, Old Road Campus, University of Oxford, Oxford OX3 7LF, UK

**Supplementary tables**

Table S1. Details of the 283 *B. multivorans* genome sequences analysed in this study

Table S2 Quality statistics of the 73 *B. multivorans* draft bacterial genomes sequenced in this study

Table S3. PCR primer sequences designed for all four *B. multivorans* lineage-specific target genes

Table S4. Growth kinetics of the *B. multivorans* strains showing growth rate, lag phase and maximum OD

Table S5. Swimming and swarming motility within the *B. multivorans* strains

Table S6. Colony morphology and EPS production of *B. multivorans*

**Supplementary Figures**

Figure S1. MLST-gene phylogeny of the 77 genome *B. multivorans* strain panel

Figure S2. Growth parameters of the *B. multivorans* strains (n = 50) at 48 h

Figure S3. Swimming and swarming motility in the *B. multivorans* strain panel after 24 h incubation at 37°C

Figure S4. Comparison of motility between lineage 1 and lineage 2 *B. multivorans* strains

Figure S5. Biofilm formation of the *B. multivorans* strain panel (n = 49) after 24 h

Figure S6. Comparison of biofilm formation between the *B. multivorans* lineages

**Table S1. Details of the 283 *B. multivorans* genome sequences analysed in this study**

## Supplementary Figures

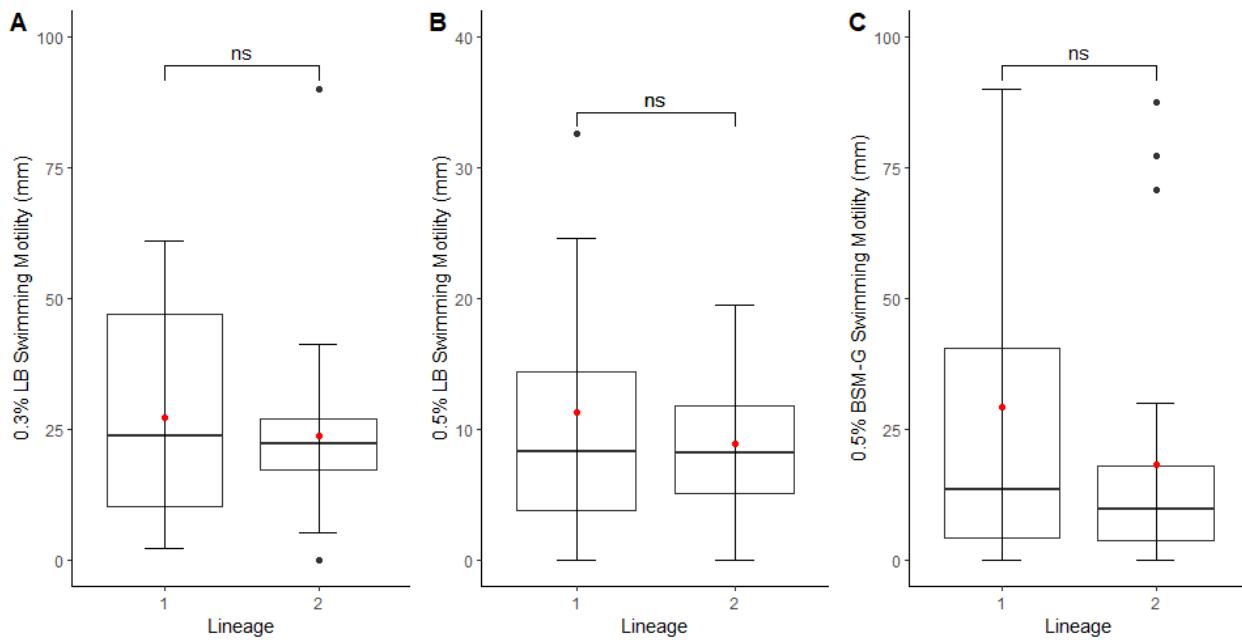

**Figure S1. MLST-gene phylogeny of the 77 genome *B. multivorans* strain panel.** The RAxML (100 bootstraps) phylogenetic tree was created by extracting the MLST sequences from the sequenced whole genomes using MLST check (Page et al. 2016b). Bootstrap values are indicated using the key. Filled circles represent a bootstrap of  $\geq 80\%$  and a hollow (white) circle means confidence of  $\leq 80\%$ . Lineages are shown on the right hand side of the figure, with colour coding illustrating the lineages and sub-lineages. Lineage 1 = red, lineage 2a = green, lineage 2b = blue. The red asterisk next to strain names represents the flipped genomes in lineage 2. Scale bar represents the phylogenetic distance of 0.004 nucleotide substitutions.

**Figure S2. Growth parameters of the *B. multivorans* strains ( $n = 50$ ) at 48 hours.** The box plots have been drawn from data produced in R using the GroFit package: (A) growth rate ( $\text{h}^{-1}$ ), (B) lag phase (hours), and (C) maximum growth (OD 480-520 nm). All box plots are annotated with the model strains on the right-hand side (red) and display the upper quartile, mean, and lower quartile. Outliers have also been added to the plots. Each parameter has been compared by *B. multivorans* lineage and no statistically significant *B. multivorans* lineage-specific differences in these growth parameters were identified ( $p > 0.05$  for comparison of mean for all plots).

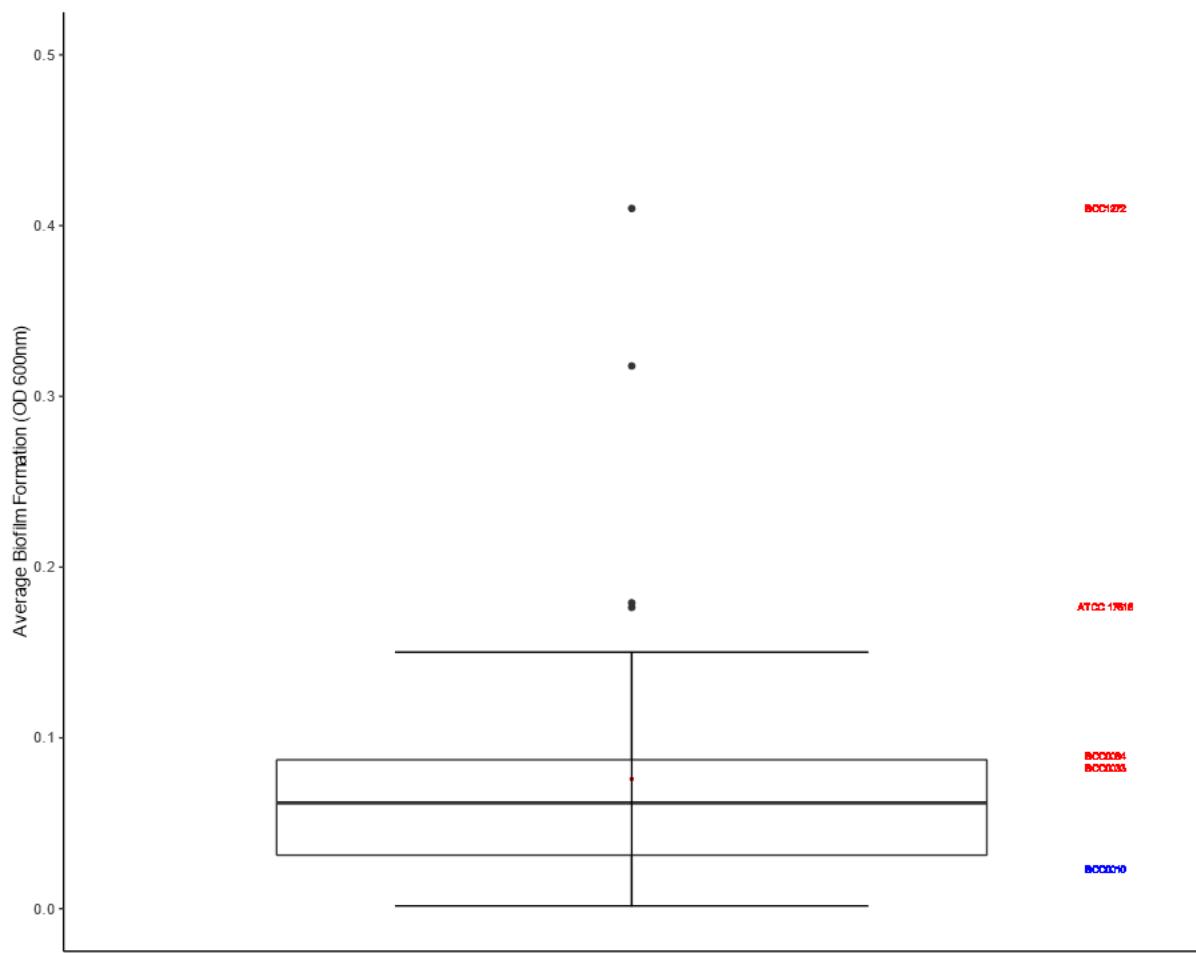

**Figure S3. Swimming and swarming motility in the *B. multivorans* strain panel after 24-hours incubation at 37°C.** (A) Swimming motility was performed on 0.3% LB agar (n = 49). Swarming motility was performed on (B) 0.5% LB agar (n = 48) and (C) 0.5% BSM-G agar (n = 44). Model *B. multivorans* strains (n = 4) are annotated in red on the righthand side of each box plot. No motility associations statistically linked to each *B. multivorans* lineage were identified.

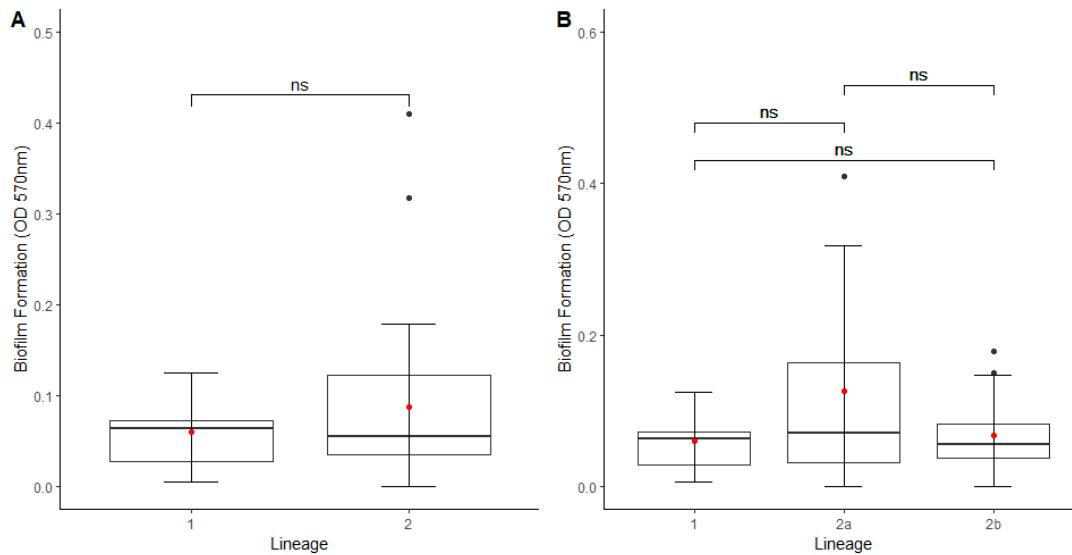

**Figure S4. Comparison of motility between lineage 1 and lineage 2 *B. multivorans* strains.**

The box plots show: (A) 0.3% LB swimming motility: Lineage 1 ( $n = 17$ ) and lineage 2 ( $n = 30$ ); (B) 0.5% LB swarming motility: Lineage 1 ( $n = 17$ ) and lineage 2 ( $n = 30$ ); (C) 0.5% BSM-G swimming motility: Lineage 1 ( $n = 17$ ) and lineage 2 ( $n = 25$ ). Statistical analysis was performed in R using a non-parametric Kruskal-Wallis test was performed on all motilities. No significant differences in motility were observed at  $p = 0.05$  as indicated (ns).

**Figure S5. Biofilm formation of the *B. multivorans* strain panel ( $n = 49$ ) after 24-hours.** Among of biofilm was assessed using the crystal violet assay, reading the results using a plate reader at 600 $\text{nm}$ . Biofilm controls were *B. multivorans* ATCC 17616 for the ‘high’ former and BCC0010 (blue) for the ‘low’ control. Model CF *B. multivorans* strains are noted in red on the right-hand side of the box plot. Box plots show the mean, lower quartile, and upper quartile for biofilm staining. Outliers are also shown. No biofilm formation abilities statistically linked to each *B. multivorans* lineage were identified.

**Figure S6. Comparison of biofilm formation between the *B. multivorans* lineages.** *B. multivorans* ATCC 17616 was used as a high biofilm control and included in all the lineage comparisons made using the *B. multivorans* sub-panel (n=49 strains compared). The box plots show: (A) Comparison of biofilm formation between lineage 1 (n = 17) and lineage 2 (n = 30); (B) Comparison of biofilm formation between lineage 1 (n = 17), lineage 2a (n = 11) and lineage 2b (n = 19). Statistical analysis was performed in R using a non-parametric Kruskal-Wallis test for two comparisons or Dunn-Test and Benjamini-Hochberg test for three comparisons. No significance differences in biofilm formation were observed at p = 0.05 as indicated (ns).
