Supplementary Information Legend

Supplementary Table S1. Primer sequences and Taqman probes used for copy number analysis to genotype *mov2.g* and *mov1* plants.

Supplementary Table S2. Sequence of KASP^{TM} markers on chromosomes 3H used to map the *mov2* locus.

Supplementary Table S3. PCR primer sequences for testing the presence of genes upstream and downstream from *HvSL1* on chromosome 3H.

Supplementary Table S4. PCR primer sequences for testing the presence of barley B-class genes.

Supplementary Table S5. PCR primer sequences for testing the presence of genes upstream and downstream from *HvMADS16* on chromosome 7H.

Supplementary Table S6. qRT-PCR primer sequences.

Supplementary Table S7. Primer sequences for *HvSL1* CRISPR knockout.

Supplementary Table S8. Primer sequence for cloning of *in situ* hybridization antisense and sense probes.

Supplementary Table S9. Primer sequences for BiFC cloning.

Supplementary Table S10. Floral organ frequency in wild-type and *mov2.g*.

Supplementary Table S11. Annotated genes present in the mapped *mov2* critical interval between flanking markers chr3H_9748112 and chr3H_10289104.

Supplementary Table S12. BLASTp results using barley HvSL1 as query against the rice genome.

Supplementary Table S13. BLASTp results using rice OsSL1 as query against the barley genome.

Supplementary Table S14. Observed segregation ratios of *mov1* phenotype in heterozygous growing material.

Supplementary Table S15. Genes on chromosome 7H tested by PCR.

Supplementary Fig. S1. Histological sections of *mov2.g* carpels.

Supplementary Fig. S2. Spike morphology of wild-type and *mov2.g* plants.

Supplementary Fig. S3. Mapping of the *mov2* locus in a *mov2.g* x Morex bi-parental population.

Supplementary Fig. S4. Heatmap of gene expression for genes in the critical *mov2* interval.

Supplementary Fig. S5. *HvSL1* and *OsSL1* gene models and alignment.

Supplementary Fig. S6. *HvSL1* deletion in *mov2.g*.

Supplementary Fig. S7. CRISPR design and analysis of *HvsI1*-knockout plants.

Supplementary Fig. S8. BiFC assays showing interaction between barley B-class genes.

Supplementary Fig. S9. Transfection efficiency and transcript abundance in barley protoplasts.

Supplementary Fig. S10. Histological sections of *mov1* carpels.

Supplementary Fig. S11. Details of *mov1* inflorescence development.

Supplementary Fig. S12. Characterization of *mov1* deletion and *HvMADS16*.

Supplementary Fig. S13. *In situ* hybridization with sense probes on wild-type and *mov1* inflorescences.

Supplementary Table S1. Primer sequences and Taqman probes used for copy number analysis to genotype *mov2.g* and *mov1* plants. Fluorophore at 5' and 3' quencher are indicated for each probe.

Supplementary Table S10. Variation in floral organ frequency in wild-type and *mov2.g*. As an example, phenotypic variation is reported for six individual *mov2.g* florets from different spikes. All *mov2.g* florets contained 2 unaltered lodicules. WT indicates a wild-type barley floret.

Floret #	Stamen	Carpel/ carpel-like	Partially converted stamen	Comments
WT	3	1	0	
mov2.g	0	4	0	At least 2 carpels appear to contain ovules
mov2.g	0	5	0	
mov2.g	0	1	3	Three carpelloid/partially converted stamens
mov2.g	0	3	1	
mov2.g	0	6	0	Carpel-like organs vary in shape and size
mov2.g	0	7	0	Several exposed ovule-like structures

Supplementary Table S11. Annotated genes present in the mapped *mov2* critical interval between flanking markers chr3H_9748112 and chr3H_10289104. Annotations and genomic coordinates are based on the Morex reference assembly Hv_IBSC_PGSB_v2, gene order is based on Morex Scaffold_1432 (Dr. Martin Mascher, IPK Gatersleben, Germany). *HvSL1* (*HORVU3Hr1G003740*) is indicated in bold, genes tested by PCR are indicated with *.

HORVU4Hr1G085640	8e-07	22	59.4
HORVU5Hr1G018830	1.1e-06	16	62.1

Supplementary Table S14. Observed segregation ratios of *mov1* phenotype in heterozygote growing material.

Group #	Observed *mov1* phenotype	Observed wild-type phenotype	Total	χ^2 value	P-value	Output
1	68 (24%)	214 (76%)	282	0.118	0.731	**ACCEPT H_0**
2	10 (25%)	30 (75%)	40	0.000	1.000	**ACCEPT H_0**
3	10 (26%)	29 (74%)	39	0.009	0.926	**ACCEPT H_0**
4	9 (19%)	39 (81%)	48	1.000	0.317	**ACCEPT H_0**
5	41 (24%)	133 (76%)	174	0.192	0.662	**ACCEPT H_0**

H_0 = The observed phenotypes segregate with a 3:1 ratio

H_1 = Not H_0; observed phenotypes segregate differently from 3:1 ratio

Degrees of freedom (DF) = 1

Supplementary Table S15. Genes on chromosome 7H tested by PCR. All genes were present in *mov1*, except for genes shown in bold. Annotations and genomic coordinates based on the Morex reference assembly Hv_IBSC_PGSB_v2. Presence of gene *HORVU7Hr1G091190* could not be tested due to sequence repetitiveness and is therefore considered within the deletion.

Gene	Start	End	Strand	Annotation

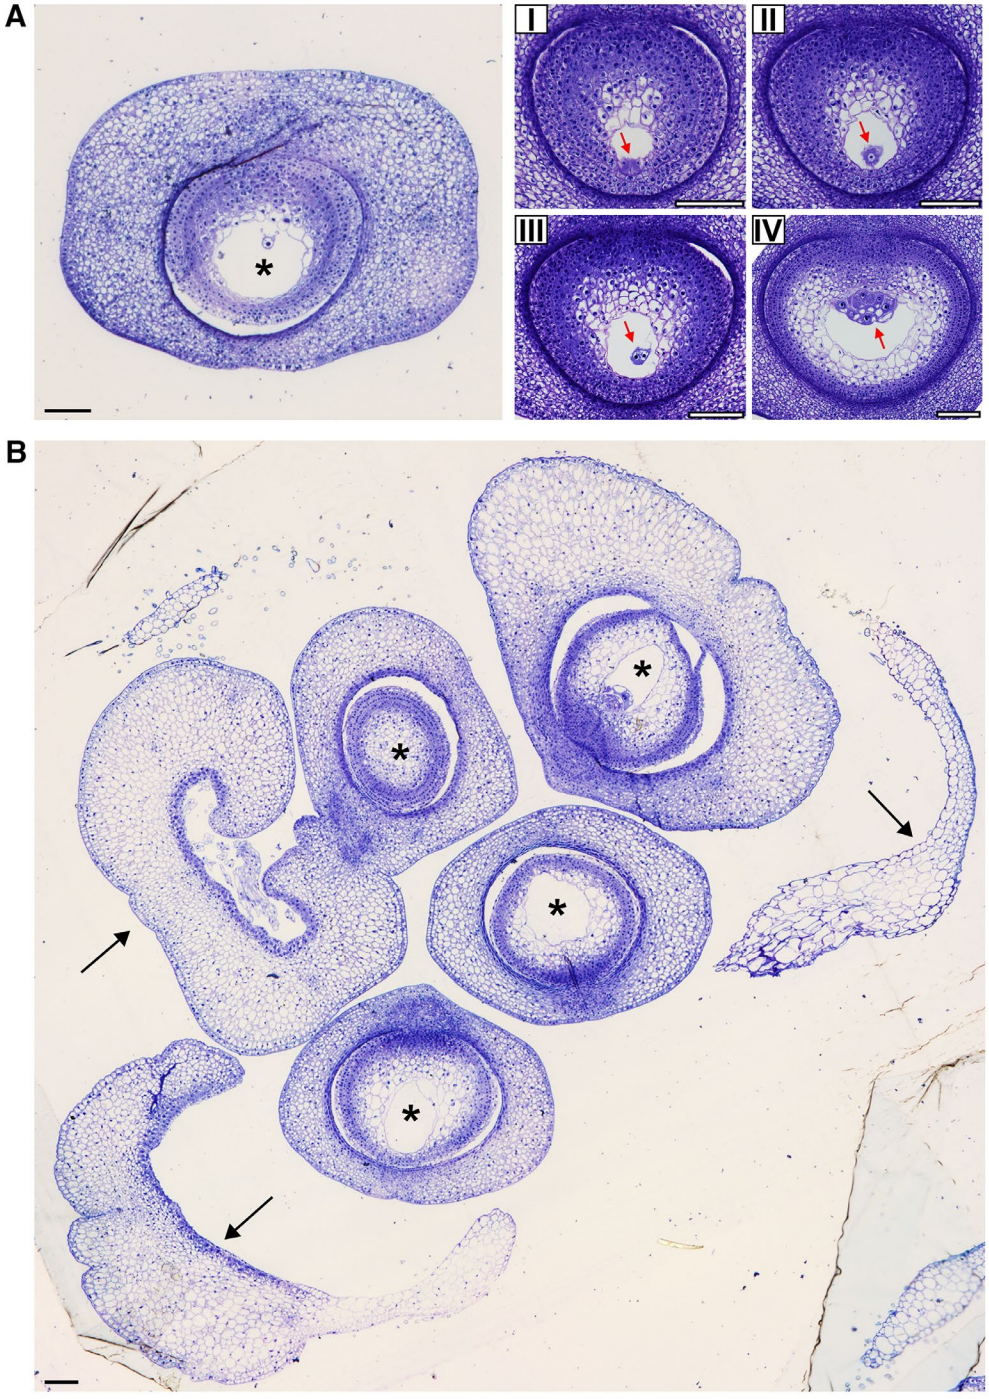
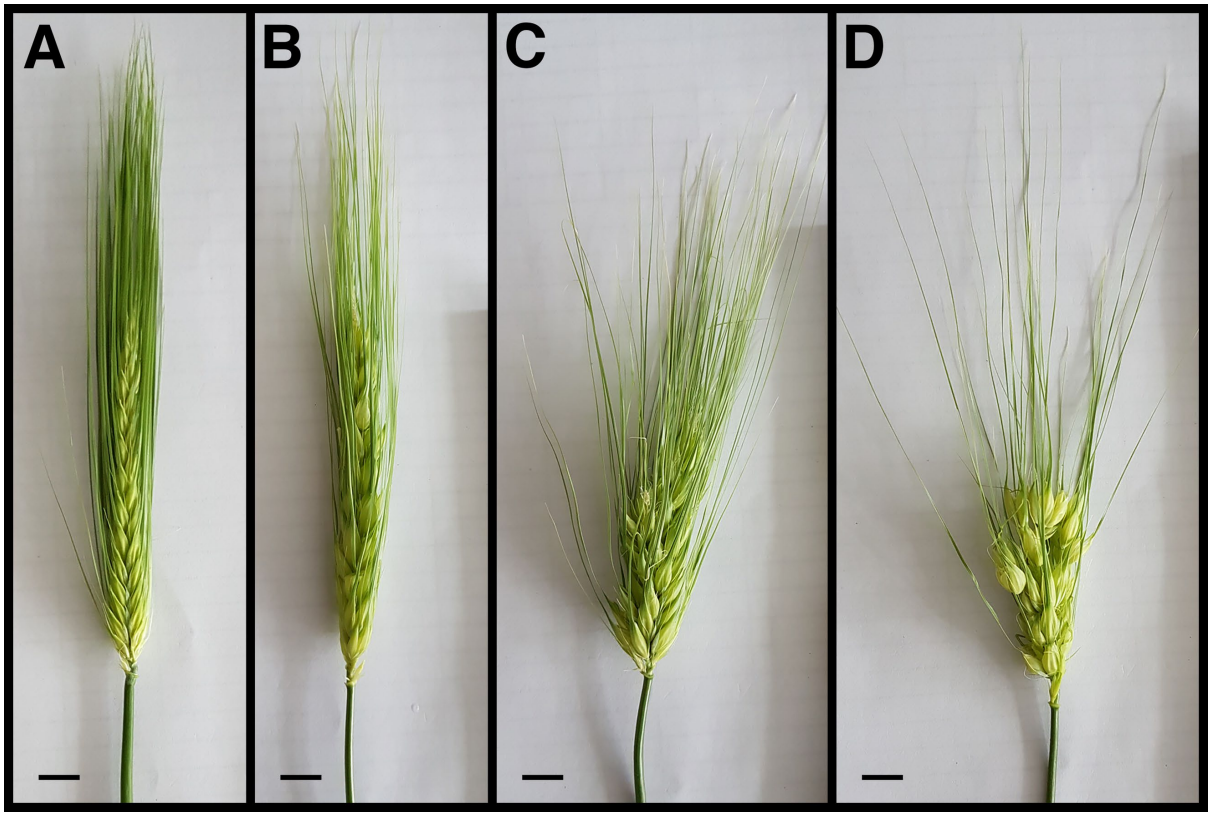
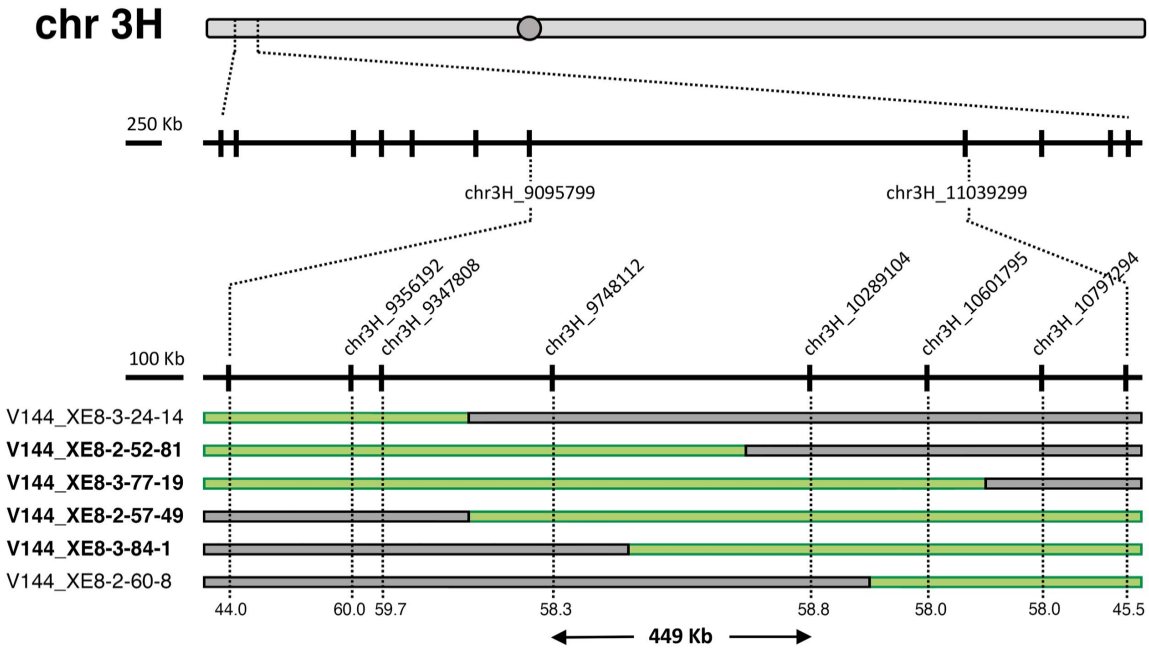
Supplementary Fig. S1. Histological sections of *mov2.g* carpels. Transverse sections of mature (**A**) wild-type and (**B**) *mov2.g* carpels stained with toluidine blue. Inset in (**A**) shows characteristics of a wild-type female gametophyte. Red arrows indicate: (**I**) synergid cells, (**II**) egg cell, (**III**) central cell and (**IV**) antipodal cells in serial sections. Black asterisks indicate ovules, whereas black arrows indicate additional carpel-like structures. Scale bars: 100 µm.



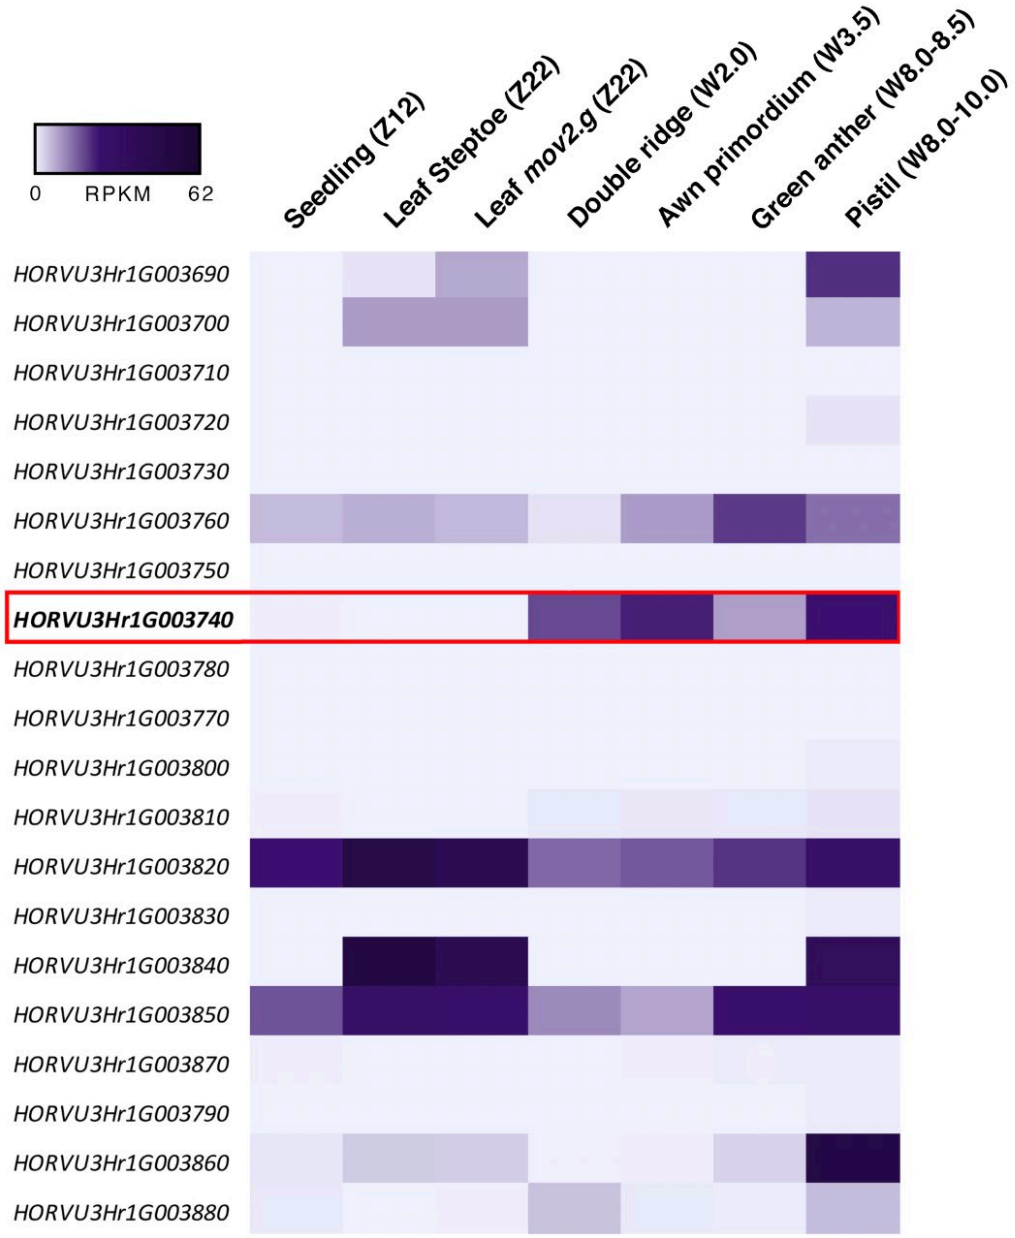
Supplementary Fig. S2. Spike morphology in wild-type and *mov2.g* plants. Representative images for (**A**) wild type and (**B-D**) *mov2.g* plants. Scale bars: 1 cm.



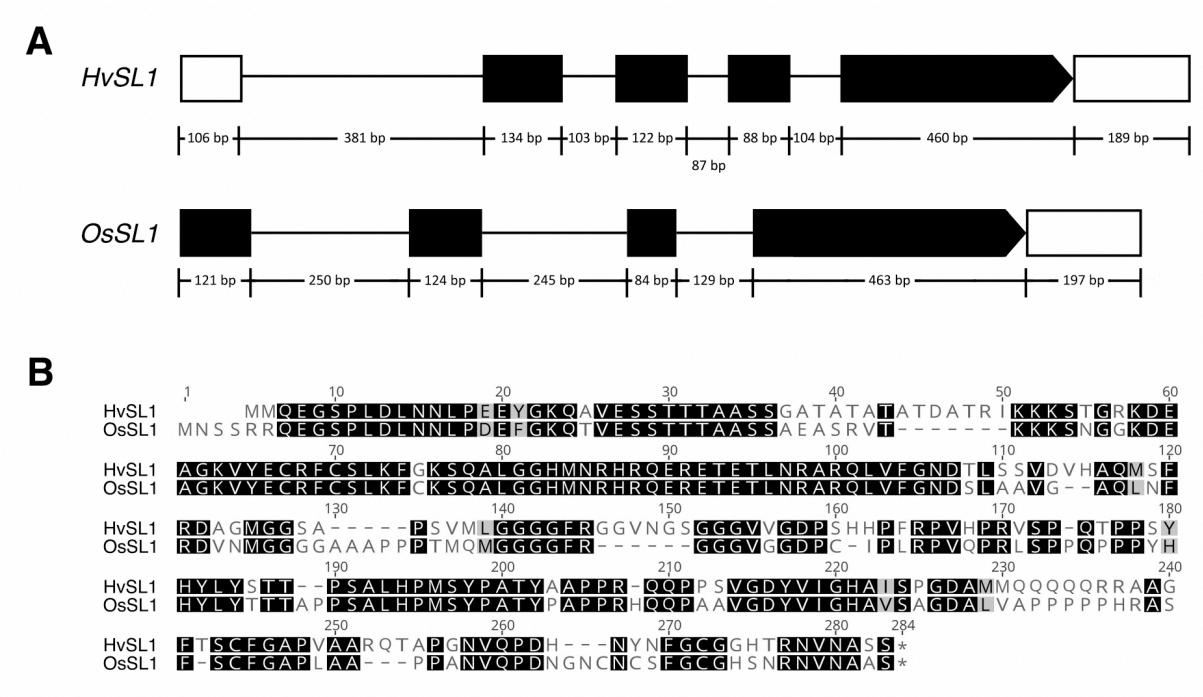
Supplementary Fig. S3. Mapping of the *mov2* locus in a *mov2.g* x Morex bi-parental population. *mov2* was initially mapped to a ~1.9 Mb interval between markers chr3H_9095799 and chr3H_11039299 based on 352 F_2 segregants. Fine mapping using 179 F_3 recombinants reduced the critical interval to ~449 Kb between markers chr3H_9748112 and chr3H_10289104. Markers are represented by vertical black lines along the chromosome. Marker order is based on the genetic map and recombination frequency (%) is reported at the bottom for each marker. Examples of mapping in F_3 recombinants: line names are indicated on the side, lines exhibiting the *mov2.g* phenotype are indicated in bold. Green: *mov2.g* allele; grey: Morex allele.



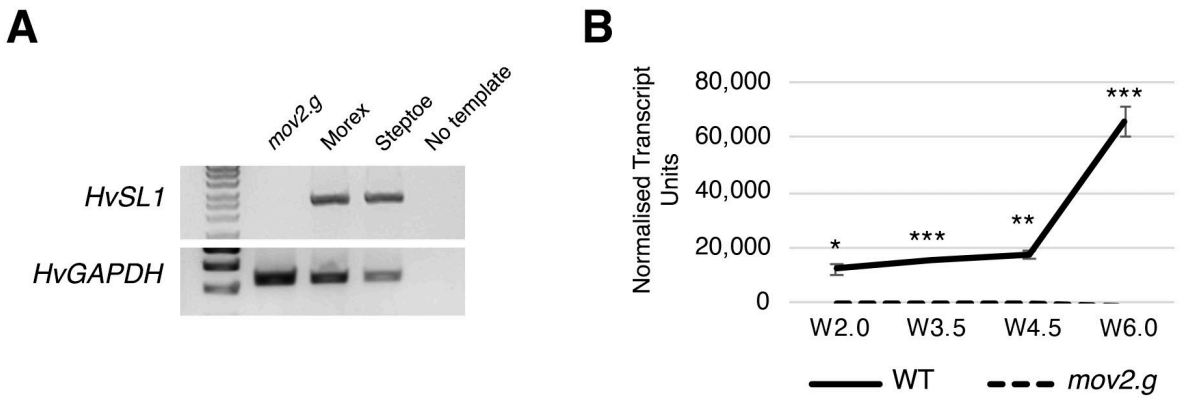
Supplementary Fig. S4. Heatmap of gene expression for genes in the critical *mov2* interval. Heatmap shows RNAseq values (RPKM) in different plant tissues for genes present in the mapped interval. Gene order is based on Morex Scaffold_1432 (Dr. Martin Mascher, IPK Gatersleben, Germany). *HvSL1* (*HORVU3Hr1G003740*) is indicated in bold and with red box. For each tissue, development based on the Zadoks or Waddington growth scale is provided.



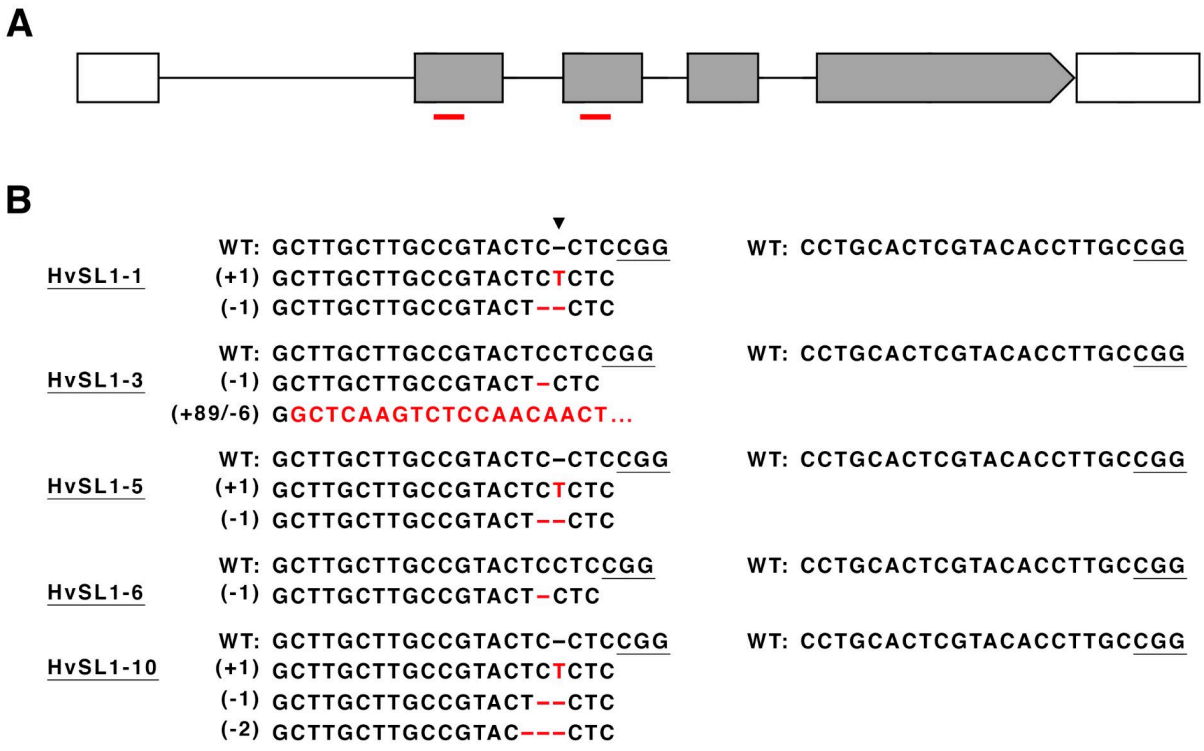
Supplementary Fig. S5. *HvSL1* and *OsSL1* gene models and alignment. (**A**) Schematic representation of barley (*HvSL1*) and rice (*OsSL1*) gene models. For each gene, the length in base pairs of Untranslated Regions (UTR – white boxes), protein-coding regions (black boxes) and introns (solid line) is indicated. (**B**) Protein alignment of barley (HvSL1) and rice (OsSL1).



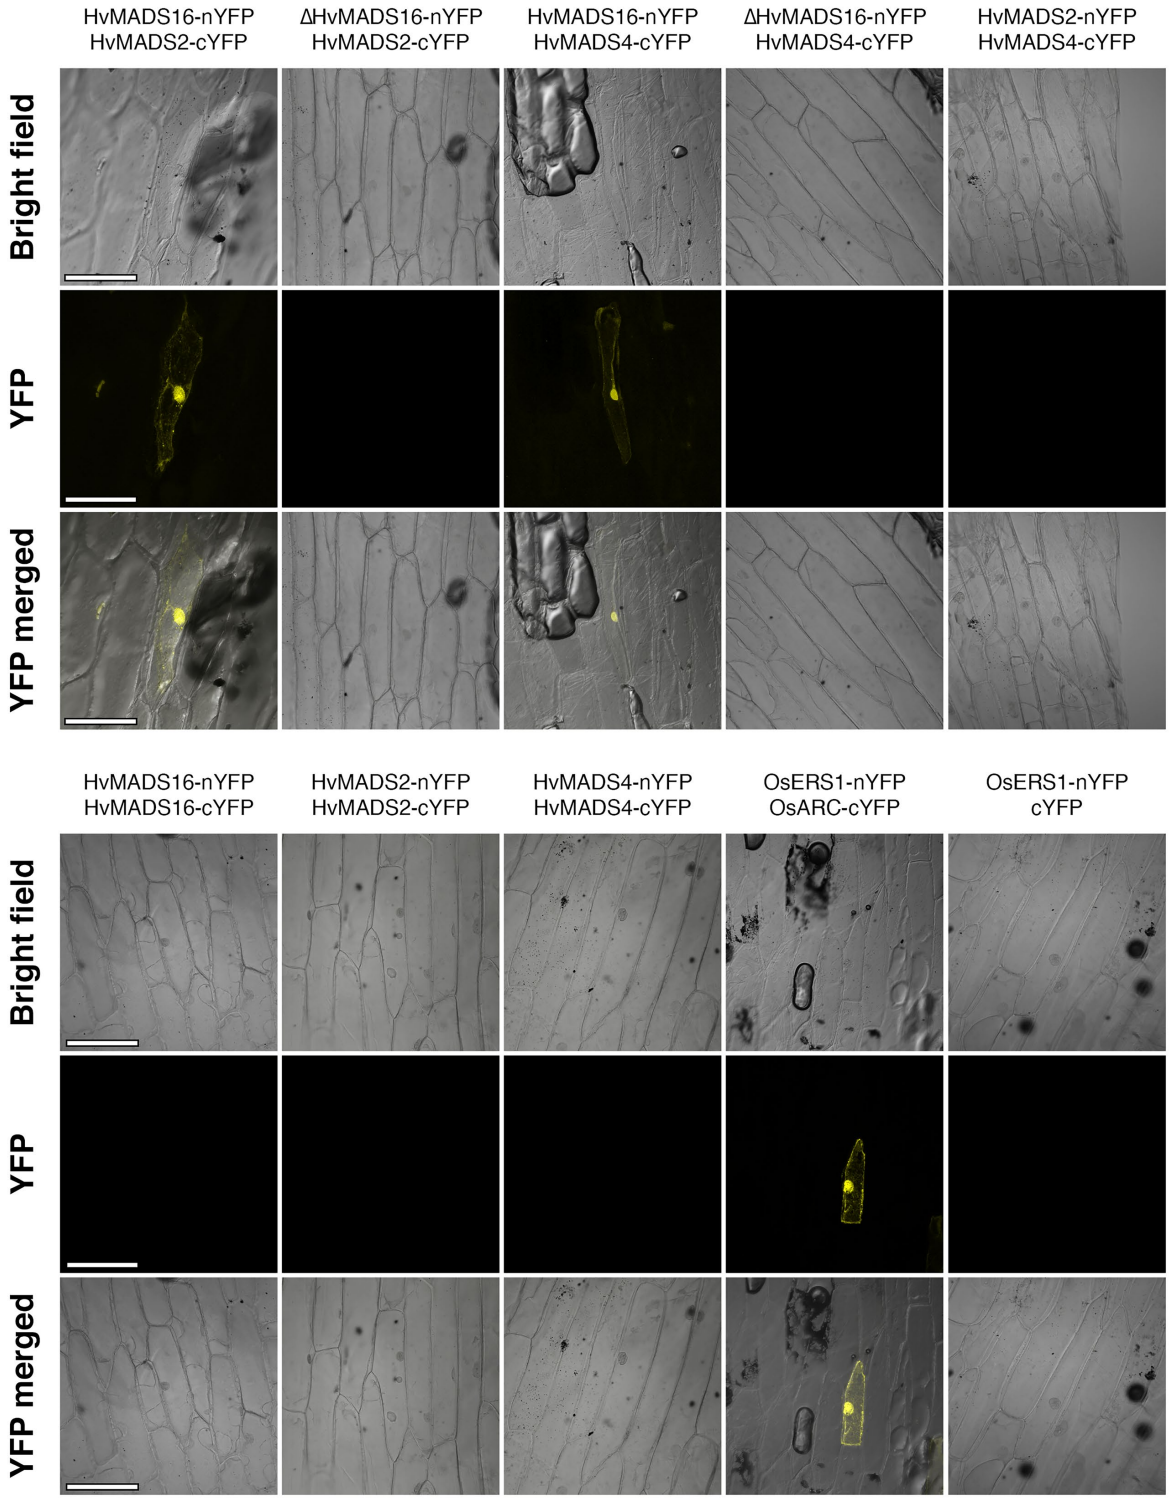
Supplementary Fig. S6. *HvSL1* deletion in *mov2.g*. (**A**) *HvSL1* appears to be absent in *mov2.g* plants when assayed by PCR. (**B**) *HvSL1* is expressed in wild-type (solid black line), but not in *mov2.g* (dashed black line) developing inflorescences at stages W2.0 (double ridge), W3.5 (stamen primordia), W4.5 (carpel primordium) and W6.0 (stamen and carpel development). Error bars represent ± Standard Error. For each timepoint, two-tailed T-test P-values ≤0.05 (*), ≤0.005 (**) and ≤0.001 (***) are shown for differences between wild type and *mov2.g*. For each sample n = 3 independent biological replicates.



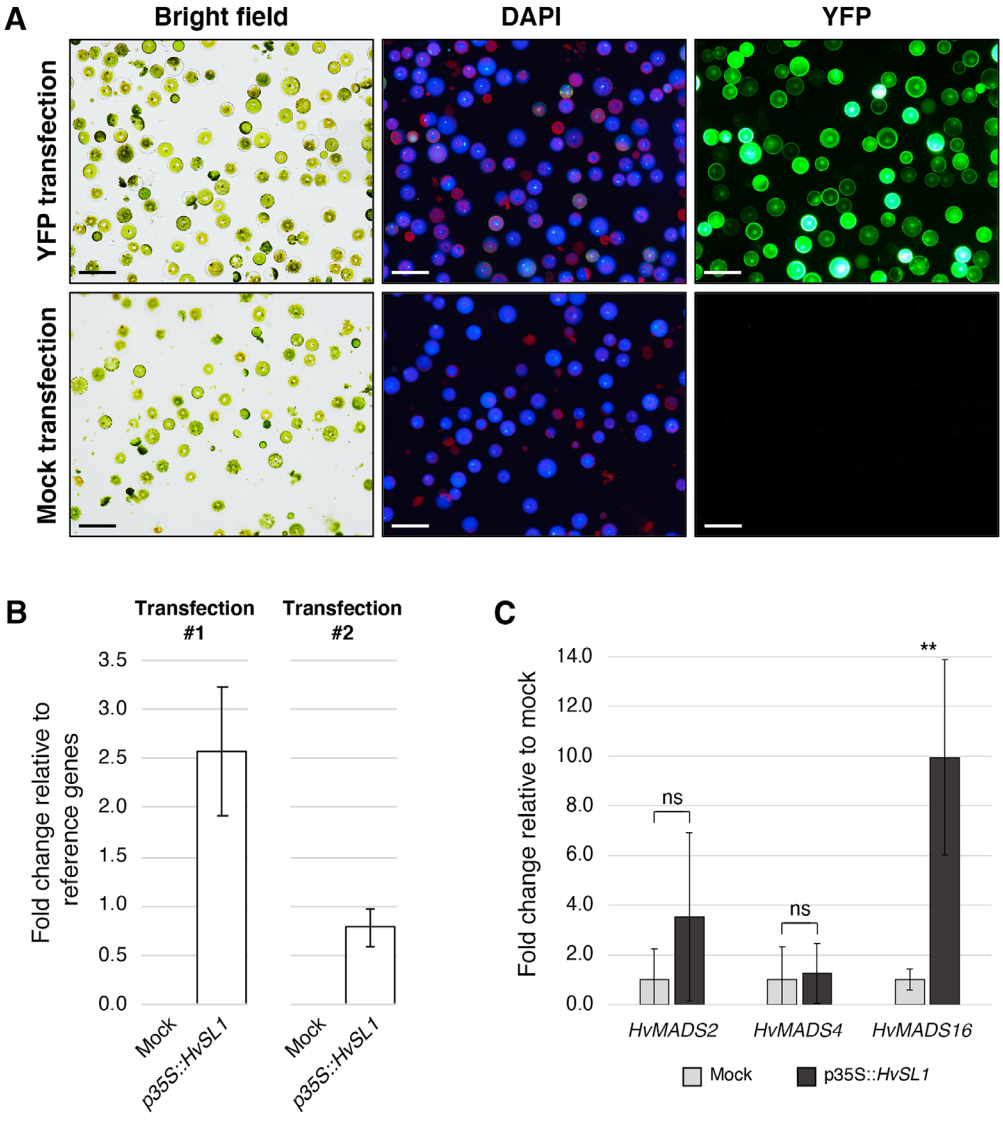
Supplementary Fig. S7. CRISPR design and analysis of *Hvsl1*-knockout plants. (**A**) Schematic representation of the *HvSL1* gene structure showing the position of gRNA1 and gRNA2 in red, protein-coding regions as grey boxes and UTR regions as white boxes. (**B**) Edits detected in gRNA1 (left column) and gRNA2 (right column) in CRISPR *Hvsl1*-knockout plants with relative insertions/deletions shown in red and indicated in brackets. PAM sequence is underlined.



Supplementary Fig. S8. BiFC assays showing interaction between barley B-class genes. nYFP indicates N-terminal of YFP (1-174), while cYFP indicates C-terminal split of YFP (175-241). Scale bars: 200 µm. A previously published interaction between rice proteins OsERS1 and OsARC was used as positive control (Yang *et al*., 2018). For each interaction, n = 4 independent transfections.

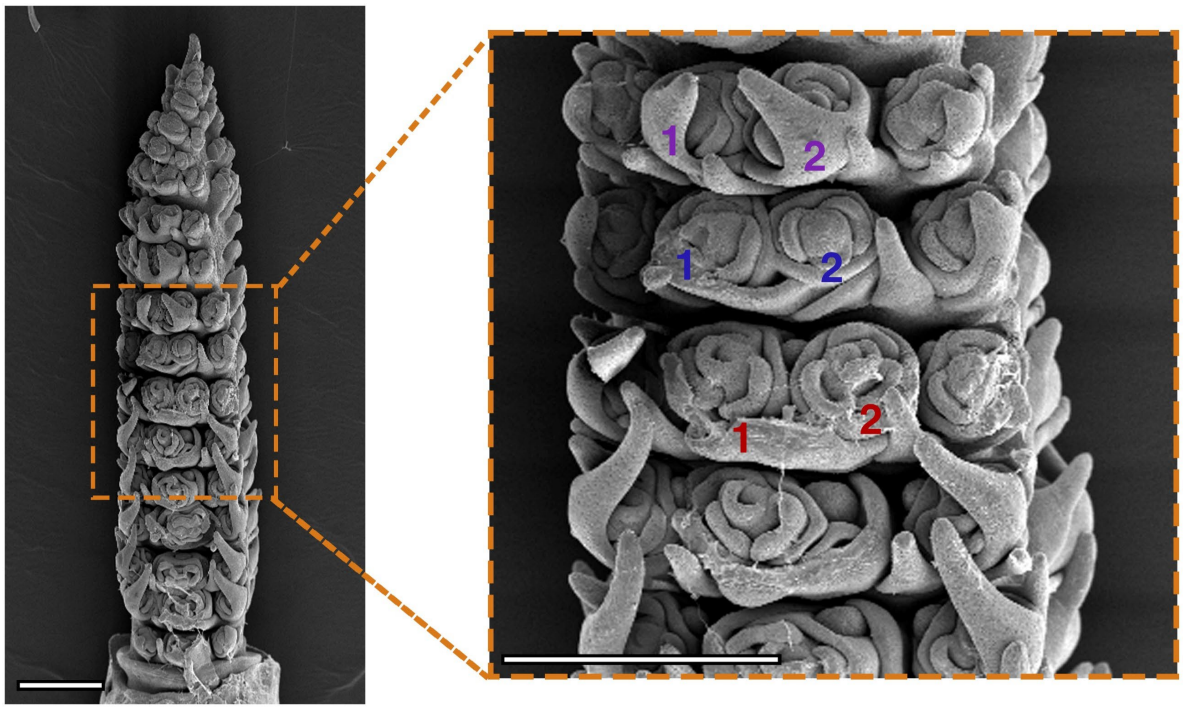


Supplementary Fig. S9. Transfection efficiency and transcript abundance in barley protoplasts. (**A**) Efficiency of protoplast transfection was calculated by averaging the number of protoplasts expressing YFP in three representative images. Scale bars: 100 µm. (**B**) *HvSL1* expression as assayed by qRT-PCR in protoplasts transfected with mock or with a construct driving constitutive *HvSL1* expression. Constitutive *HvSL1* expression is driven by the Cauliflower Mosaic Virus 35S promoter. Fold change is reported relative to barley glyceraldehyde 3-phosphate dehydrogenase (*HvGAPDH*) and cyclophilin (*HvCYCLO*). (**C**) Expression of endogenous B-class genes *HvMADS2*, *HvMADS4* and *HvMADS16* in protoplasts transfected with mock or with a construct driving constitutive *HvSL1* expression. Fold change is reported relative to the mock condition. Two-tailed T-test P-value ≤0.005 (**) is shown for differences between treatments, ns indicates no significant difference. For each sample n = 3 independent biological replicates.

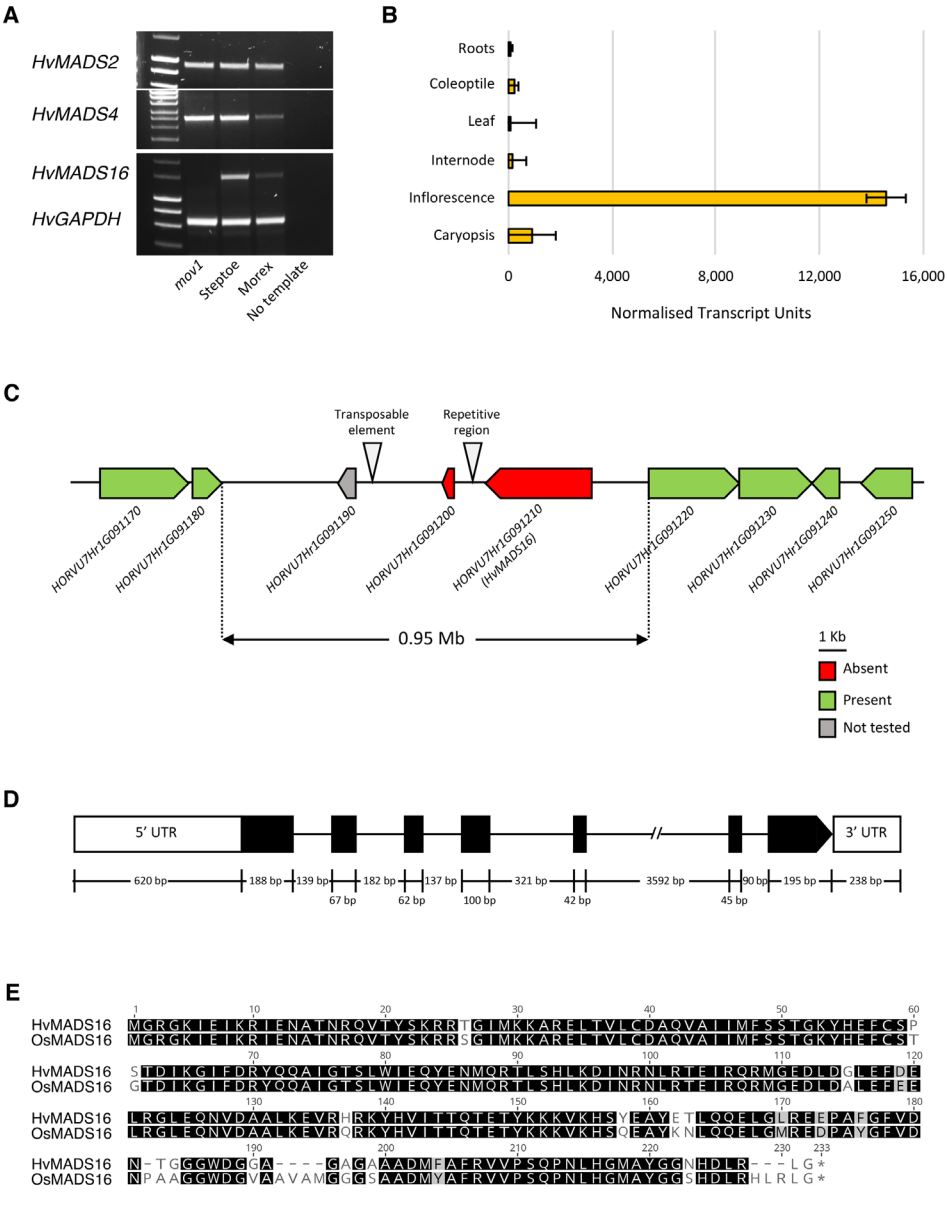


Supplementary Fig. S10. Histological sections of *mov1* carpels. Transverse sections of mature (**A**) wild-type and (**B and C**) *mov1* carpels stained with toluidine blue. Black asterisks indicate the ovule-like structures in the multiovary mutant. Scale bars: 100 µm.

Supplementary Fig. S11. Details of *mov1* inflorescence development. Enlargement of the *mov1* inflorescence shown in Fig. 7 at W5.0, highlighting in greater detail the multiple florets (numbered 1 & 2) arising from a single floral meristem. Scale bars: 500 µm.



Supplementary Fig. S12. Characterization of the *mov1* deletion and *HvMADS16*. (**A**) *HvMADS16* is the only B-class gene physically absent in *mov1* when assayed by PCR. The barley glyceraldehyde 3-phosphate dehydrogenase *HvGAPDH* gene was used as reference. (**B**) Transcript abundance of *HvMADS16* in a Steptoe tissue series as assayed by qRT-PCR. For details about tissue sampling refer to Materials and Methods. (**C**) Schematic representation of the deletion in *mov1* as assayed by PCR. Deletion size in *mov1* is estimated to be no bigger than 0.95 Mb, based on the Morex reference assembly Hv_IBSC_PGSB_v2. (**D**) *HvMADS16* gene structure; length in base pairs of Untranslated Regions (UTR), protein-coding regions (black) and introns (solid line) is indicated. (**E**) Protein alignment of barley (HvMADS16) and rice (OsMADS16), sharing 88.3% sequence identity.



Supplementary Fig. S13. *In situ* hybridization with sense probes on wild-type and *mov1* inflorescences. Sense probes for *HvMADS16*, *HvMADS3*, *HvMADS13* and *HvDL* were assayed on wildtype (WT) and *mov1* inflorescences at stage W6.0. Lemma (le), lodicule (lo), stamen (st), carpel (ca), ovule (ov) and carpel-like structure (cl). Scale bars: 250 µm.
