

Supplemental information

**Mitogenomic exploration supports the historical
hypothesis of anthropogenic diffusion
of a zoonotic parasite *Echinococcus multilocularis***

Naoki Hayashi, Ryo Nakao, Yuma Ohari, Takao Irie, Hirokazu Kouguchi, Elisha Chatanga, Wessam Mohamed Ahmed Mohamed, Mohamed Abdallah Mohamed Moustafa, Gohta Kinoshita, Munehiro Okamoto, Kinpei Yagi, and Nariaki Nonaka

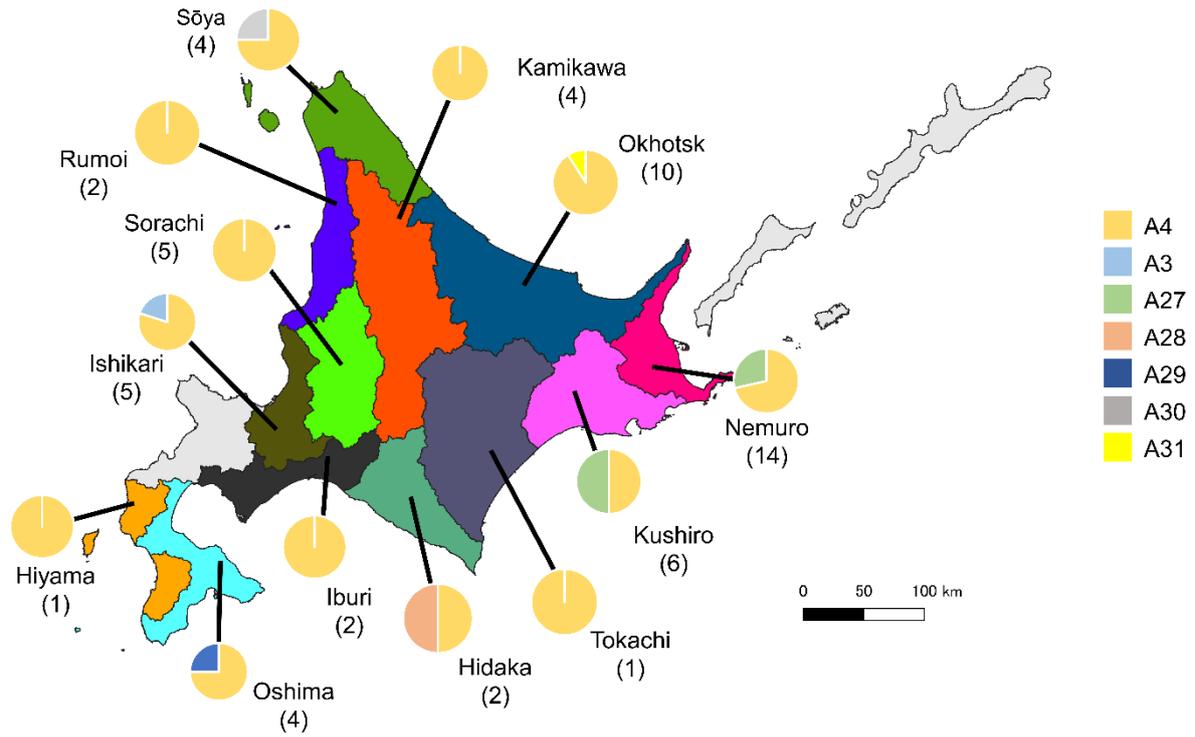

Figure S1. Geographical mapping of detected haplotypes based on three mitochondrial protein coding sequences (CYTB/ND2/COI) of *Echinococcus multilocularis*, related to Table 1. The numbers of parasites, distribution, and frequency of each haplotype on 13 subprefectures in Hokkaido are shown. The color of each pie chart corresponds to the haplotypes listed on the right.

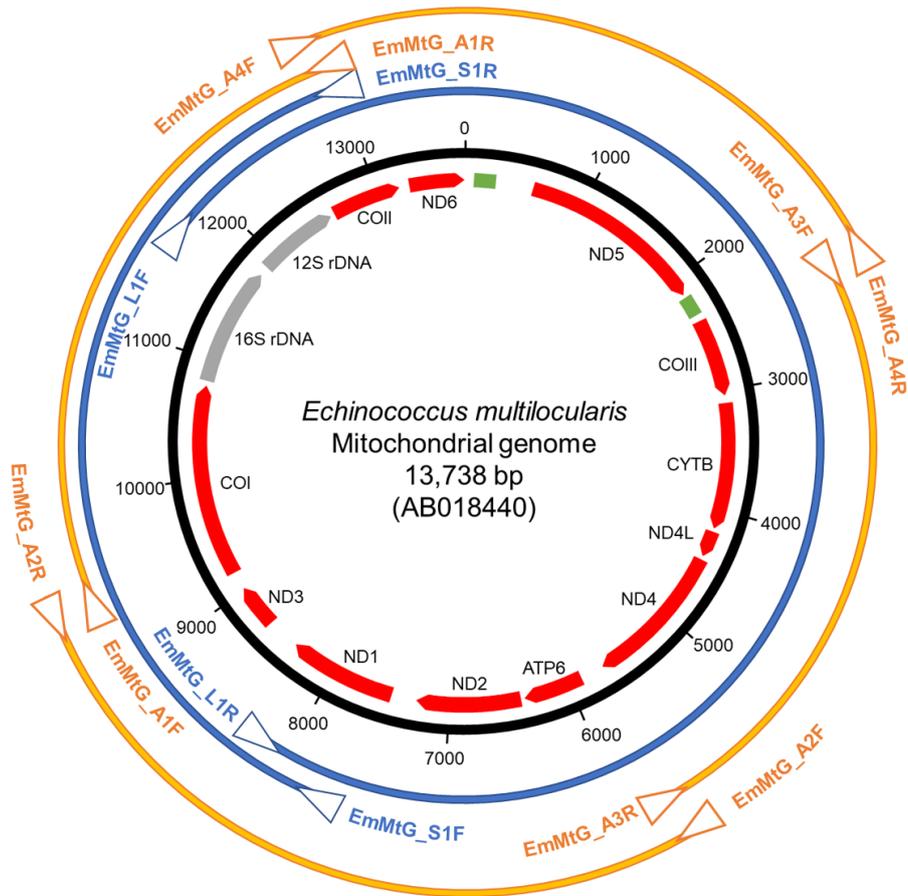

Figure S2. PCR strategies for mitochondrial genome construction, related to STAR Methods. The diagram of the mitochondrial genome of *E. multilocularis* (Accession no. AB014880) is illustrated with protein-coding sequences (red), ribosomal RNA (gray), and two major noncoding regions (green). Blue lines are two overlapping PCR fragments. Orange lines are four alternative PCR fragments. Arrowheads show each primer position.

Table S2. Bayes factors (BFs) between two locations, related to Figure 4.
