

## Supplementary appendix

**Supplementary Materials: Fig. S1** a, Western blotting detected the expression of DPP4 on these monocytes, and pancreatic tissue was used as a positive control. b, CCK8 assay was used to observe the effects of different concentrations of anagliptin on the proliferation and viability of BMMs. Monocytes were either untreated or pretreated with different concentrations of anagliptin (10 µM, 20 µM, 50 µM, 100 µM) for 24 h, absorbance at 450 nm were detected and are presented (mean ± S.E)
