

Figure S1. Isolation and identification of exosomes. (A) Morphology of exosomes isolated from serum samples was identified by transmission electron microscopy. (B) Size of exosomes ranged from 30-150 nm. (C) Western blot analysis of the expression levels of exosome marker proteins, including CD63, TSG101 and HSP70, in the exosomes. HSP70, heat-shock 70; TSG101, tumor susceptibility gene 101.
