

Supplemental Material for
Biomarkers of gut barrier dysfunction and risk of hepatocellular carcinoma in the REVEAL-HBV and REVEAL-HCV Cohort Studies

Jessica L. Petrick, Andrea A. Florio, Jane Zen, Yanyu Wang, Andrew T. Gewirtz, Ruth M. Pfeiffer, Sarah Loftus, Jon Inglefield, Jill Koshiol, Baiyu Yang, Kelly Yu, Allan Hildesheim, Chien-Jen Chen, Hwai-I Yang, Mei-Hsuan Lee, Katherine A. McGlynn

Table of Contents:

Supplemental Tables S1 and S2

Supplemental Table S1. Spearman correlation coefficients for markers of gut bacterial translocation among controls in the REVEAL-HBV and REVEAL-HCV studies.

	anti-Flagellin			anti-LPS		SCD14	LBP	ALT
	IgA	IgG	IgM	IgA	IgG	IgM		
anti-flagellin IgA	1.000	0.813*	0.485*	0.803*	0.694*	0.116	-0.062	0.171*
anti-flagellin IgG		1.000	0.587*	0.615*	0.776*	0.100	0.016	0.227*
anti-flagellin IgM			1.000	0.403*	0.422*	0.569*	0.038	0.068
anti-LPS IgA				1.000	0.747*	0.162*	0.011	0.141*
anti-LPS IgG					1.000	0.102	-0.021	0.136*
anti-LPS IgM						1.000	0.070	-0.091
Soluble CD14							1.000	0.456*
LPS Binding Protein								1.000
ALT								1.000

*P<0.05.

Supplemental Table S2. Multivariate adjusted odds ratios (ORs) and 95% confidence intervals (CIs) for the associations between markers of gut bacterial translocation and hepatocellular carcinoma (HCC) among participants of the REVEAL-HBV and REVEAL-HCV cohorts, excluding cases diagnosed within 5 years of baseline.

	REVEAL-HBV				REVEAL-HCV			
	Controls	Cases	OR ¹	95% CI	Controls	Cases	OR ²	95% CI
anti-Flagellin IgA

¹Unconditional logistic regression adjusted for age, sex, HBV DNA copies at baseline, smoking status, alcohol consumption, BMI, education status, baseline cirrhosis status, ALT, and HbeAG.

²Conditional logistic regression adjusted for matching factors (age, sex, and HCV-RNA-positive rate), smoking status, alcohol consumption, BMI, education status, baseline cirrhosis status, baseline diabetes status, ALT, and HCV genotype.

³P-value for trend calculated using the

Wald test.
