

BMJ Open

BMJ Open is committed to open peer review. As part of this commitment we make the peer review history of every article we publish publicly available.

When an article is published we post the peer reviewers' comments and the authors' responses online. We also post the versions of the paper that were used during peer review. These are the versions that the peer review comments apply to.

The versions of the paper that follow are the versions that were submitted during the peer review process. They are not the versions of record or the final published versions. They should not be cited or distributed as the published version of this manuscript.

BMJ Open is an open access journal and the full, final, typeset and author-corrected version of record of the manuscript is available on our site with no access controls, subscription charges or pay-per-view fees (<http://bmjopen.bmj.com>).

If you have any questions on BMJ Open's open peer review process please email info.bmjopen@bmj.com

8 26 Global, regional, and national burden of traumatic brain injury and spinal cord injury, 1990–
9
10 27 2019: a systematic analysis for the Global Burden of Disease Study 2019
11
12
13 28

15
16 29 **Abstract**
17
18 30

21 31 **Objectives:** To evaluate the most up-to-date burden of traumatic brain injury (TBI) and spinal
22
23 32 cord injury (SCI) and analyze their leading causes in different countries and territories.
24
25
26 33

28
29 34 **Design:** Cross-sectional.
30
31 35

33
34 36 **Setting:** The epidemiologic data were gathered from the Global Burden of Disease (GBD)
35
36 37 Results Tool (January 1, 1990 to December 31, 2019) covering 21 GBD regions and 204
37
38 38 countries and territories.
39
40
41 39

42
43
44 40 **Participants:** Patients with TBI and SCI.
45
46
47 41

48
49 42 **Main outcomes and measures:** Absolute numbers and age-standardized rates/estimates of
50
51 43 incidence, prevalence, and years lived with disability (YLDs) of TBI and SCI by location in
52
53 44 2019, with their percentage changes from 1990 to 2019. The most common causes (e.g., falls)
54
55 45 of TBI and SCI in 204 countries and territories.
56
57
58
59
60

1
2
3 46
4
5 47 **Results:** Globally, in 2019, TBI had 27.16 million new cases, 48.99 million prevalent cases,
6
7
8 48 and 7.08 million YLDs. Global age-standardized incidence rates of TBI decreased
9
10 49 significantly by -5.5% (95% uncertainty interval, -8.9% to -3.0%) from 1990 to 2019,
11
12
13 50 whereas SCI had no significant change (-6.1% [-17.3% to 1.5%]). Regionally, in 2019,
14
15
16 51 Eastern Europe had the highest burden of TBI. Nationally, in 2019, Slovenia and Afghanistan
17
18 52 had the highest age-standardized incidence rates of TBI and SCI, respectively. For TBI, falls
19
20
21 53 was the leading cause in 74% (150/204) of countries and territories, followed by pedestrian
22
23
24 54 road injuries (14%, 29/204), motor vehicle road injuries (5%, 11/204), and conflict and
25
26 55 terrorism (2%, 4/204). For SCI, falls was the leading cause in 97% (198/204) of countries and
27
28
29 56 territories, followed by conflict and terrorism (3%, 6/204).

30
31 57
32
33
34 58 **Conclusions:** Global age-standardized incidence rates of TBI have decreased significantly
35
36 59 since 1990, whereas SCI had no significant change. The leading causes of TBI and SCI
37
38
39 60 globally were falls, but variations did exist between countries and territories. Policymakers
40
41
42 61 should continue to prioritize interventions to reduce falls, but priorities may vary between
43
44 62 countries and territories.

45
46
47 63

48
49 64 **Strengths and limitations of this study**

50
51
52 65
53
54
55
56
57
58
59
60

- 1
2
3 66 ● The 2019 iteration of the GBD study was the most up-to-date and superseded all previous
4
5 67 iterations. Therefore, one of the strengths of this study was that it provided the most up-
6
7
8 68 to-date global, regional, and national burden of TBI and SCI from 1990 to 2019.
9
10
11 69
12
13
14 70 ● Previous studies analysed the leading cause of TBI and SCI at the regional level, which
15
16 71 prevented policymakers from identifying variations that can exist between countries and
17
18 72 territories within a same region. Therefore, another strength of this study was that it
19
20 73 presented the variations of leading causes in 204 different countries and territories, which
21
22 74 have not been assessed before.
23
24
25
26
27 75
28
29
30
31 76 ● One of the limitations was that the results of some data-sparse countries and territories
32
33 77 should be interpreted carefully because estimates in some data-sparse countries and
34
35 78 territories were modelled and predicted by borrowing estimates from data-rich countries
36
37 79 and territories.
38
39
40
41
42 80
43
44
45 81 ● The second limitation was that the data sources relied on patients having medical records,
46
47 82 which may have underestimated the burden of some conditions.
48
49
50
51 83
52
53
54 84 ● The third limitation was that SCI would be matched to the individual who experience
55
56 85 both TBI and SCI according to the GBD severity hierarchy, which may cause some
57
58 86 underestimation of the burden of TBI.
59
60

87

88 Introduction

89

90 Traumatic brain injury (TBI) and spinal cord injury (SCI) continue to pose challenges to the
91 global public health systems, and the resulting disabilities have brought huge economic
92 burden to patients, public health systems, and societies [1, 2]. Compared with the previous
93 Global Burden of Disease (GBD) 2016 study [3, 4], new available data sources and improved
94 statistical methods in the GBD 2019 study led to the GBD 2019 results superseding those
95 from previous rounds of GBD [5]. Besides, nine additional countries and territories were
96 firstly incorporated in the calculation of disease burden in the GBD 2019 study [5]. An update
97 on the 2016 results of the burden of TBI and SCI is therefore warranted.

98

99 Ding et al. reported the burden of SCI at the global and regional levels through the GBD 2019
100 data, but did not mention the burden of SCI in individual countries and territories [6].
101 However, it will not allow for identifying variations that can exist between countries and
102 territories within a same world or a same region, which may bring biased information to
103 health care professionals. Take the previous GBD 2016 study as an example, the leading
104 cause of TBI in the region, North Africa and Middle East, was concluded to be falls [4]. It
105 was true in Saudi Arabia, whereas it did not reflect the reality in other countries and territories
106 within North Africa and Middle East, such as, Afghanistan, where conflict and terrorism was
107 the leading cause of TBI [4]. Failure to present the data in individual countries and territories
108 can prevent health care professionals from identifying which causes should be targeted;

1
2
3 109 wasting resources and reducing effectiveness of any interventions [7].
4
5
6 110
7

8 111 Therefore, in this study, we aimed to provide the most up-to-date burden of TBI and SCI
9
10 112 through the GBD 2019 data. Also, we analyzed the leading causes of TBI and SCI in 204
11
12 113 individual countries and territories. Finally, the relationship between the burden of TBI and
13
14 114 SCI and Socio-demographic Index (SDI) in 204 countries and territories was explored.
15
16 115

17 18 19 20 21 116 **Methods** 22

23 24 117 25 26 118 **Overview** 27

28
29 119
30
31 120 This study of global health estimates followed the Guidelines for Accurate and Transparent
32
33 121 Health Estimates Reporting (GATHER) Statement and the Strengthening the Reporting of
34
35 122 Observational Studies in Epidemiology (STROBE) Statement [8, 9]. The Global Burden of
36
37 123 Disease (GBD) 2019 study estimated burden of 369 diseases and injuries and 87 risk factors
38
39 124 through multiple epidemiological measures, including incidence, prevalence, mortality, years
40
41 125 of life lost (YLLs), years lived with disability (YLDs), and disability-adjusted life years
42
43 126 (DALYs) by age, sex, cause, year, and location from 1990 to 2019 [5]. Our methods used for
44
45 127 estimation of the burden of traumatic brain injury (TBI) and spinal cord injury (SCI) were
46
47 128 based on the framework of the GBD 2019 study, which had already been described
48
49 129 comprehensively elsewhere [5, 10].
50
51
52
53
54
55
56
57
58
59
60

131 Case Definitions

132

133 Based on the framework of the GBD 2019 study [5], the definitions of TBI and SCI in this
134 study relied on the International Classification of Diseases, Ninth Revision (ICD-9) and the
135 International Classification of Diseases, Tenth Revision (ICD-10), which had also been
136 described in details in the previous GBD 2016 study published in The Lancet Neurology [4].
137 Additionally, a clarification from the GBD 2019 study is that TBI and SCI are both defined as
138 a nature-of-injury but not a cause-of-injury [5]. For example, TBI and SCI could be caused by
139 a fall, the fall was therefore defined as a cause-of-injury and TBI and SCI as a nature-of-
140 injury. Although TBI and SCI could cause death, they were not defined as a cause-of-death in
141 the GBD 2019 study [5]. Therefore, in this study, we provided the burden of TBI and SCI by
142 incidence, prevalence, and YLDs, but not mortality or YLLs.

143

144 Data Source

145

146 The data for 21 GBD regions and 204 countries and territories between January 1, 1990, and
147 December 31, 2019, were available from the GBD Results Tool
148 (<https://vizhub.healthdata.org/gbd-results/>). The data utilized in this study were from patients
149 who required medical care and received a diagnosis code, which included patients warranting
150 inpatient care (referring to patients with sufficient severity to require overnight
151 hospitalization) and patients warranting outpatient care (referring to patients treated in
152 outpatient or emergency department) [5]. Additionally, considering that there are variations in

1
2
3 153 quality of data by each country and territory, estimates in some data-sparse countries and
4
5 154 territories were modelled and predicted by borrowing estimates from data-rich countries and
6
7
8 155 territories [5]. More details of the data sources and model strategies have been published
9
10
11 156 elsewhere [5, 10].
12

13
14
15 157

16 158 **Calculation of Incidence, Prevalence, and Years Lived with Disability**

17
18
19 159

20
21 160 The features of data processing used to calculate incidence, prevalence, and YLDs in this
22
23
24 161 study were consistent with the framework of the GBD 2019 study [5]. First, the data inputs of
25
26 162 different cause-of-injury were incorporated and modelled by a Bayesian meta-regression tool,
27
28
29 163 DisMod-MR 2.1, to infer the incidence of each cause-of-injury. Second, the GBD severity
30
31 164 hierarchy for nature-of-injury (**eTable 1**) was utilized to establish a point-to-point relationship
32
33
34 165 between cause-of-injury and nature-of-injury, which means that when multiple nature-of-
35
36 166 injuries were caused by one cause-of-injury, nature-of-injury with the highest rank in the
37
38
39 167 GBD severity hierarchy was selected to match it. Based on the framework of the GBD 2019
40
41
42 168 study [5], because SCI had a higher rank in the GBD severity hierarchy than TBI, SCI was
43
44
45 169 chosen if both conditions happened to an individual in our study, which was also consistent
46
47 170 with the calculation process of the previous GBD 2016 study published in The Lancet
48
49
50 171 Neurology [4]. Third, for the short-term disability (the duration was less than one year), the
51
52 172 prevalence was approximately calculated as the incidence multiplied by the average duration.
53
54
55 173 For the long-term disability (the duration was more than one year), DisMod-MR 2.1 was
56
57 174 utilized to convert incidence to prevalence. Fourth, the GBD disability weights (**eTable 2**)
58
59
60

1
2
3 175 were utilized to calculate YLDs. The GBD disability weights were evaluated on a 0–1 scale,
4
5 176 with 0 representing complete health and 1 representing death [11]. For the short-term
6
7
8 177 disability, YLDs were calculated as the prevalence multiplied by the GBD disability weights.
9
10
11 178 For the long-term disability, YLDs were calculated with the similar process but adjusted by
12
13 179 comorbidity correction. Finally, the incidence, prevalence, and YLDs were aggregated to
14
15
16 180 calculate the all-cause incidence, prevalence, and YLDs of TBI and SCI. Due to some
17
18 181 sampling errors and non-sampling variances, we calculated the 95% uncertainty interval (UI)
19
20
21 182 using the same methods described previously in the GBD 2019 study [5]. Generally, UI were
22
23
24 183 from 1,000 draw-level estimates for each parameter, and 95% UI were defined by the 25th and
25
26 184 975th values of the ordered 1,000 estimates.

185

186 **Statistical Analysis**

187

188 Firstly, according to the GBD location hierarchy (**eTable 3**) in the GBD 2019 study [5], we
189 calculated absolute numbers and age-standardized rates/estimates of incidence, prevalence,
190 and YLD of TBI and SCI in 21 GBD regions and 204 countries and territories in 2019. The
191 age-standardized rate/estimate is calculated by $\frac{\sum_{i=1}^A a_i w_i}{\sum_{i=1}^A w_i}$, where a_i is the age-specific
192 rate/estimate of the age group i , and w_i is the weight of the age group i derived from the GBD
193 2019 world population standard (**eTable 4**) [12]. Secondly, based on the framework of the
194 GBD 2019 study [5], we used percentage changes of age-standardized rates/estimates of
195 incidence, prevalence, and YLD to calculate trends in the burden of TBI and SCI from 1990
196 to 2019. If the 95% UI of a percentage change did not include zero, it was determined to be a

1
2
3 197 significant change, and vice versa [13]. Thirdly, according to the GBD cause hierarchy
4
5 198 (**eTable 5**) in the GBD 2019 study [5], we analyzed the most common causes (e.g., falls,
6
7
8 199 pedestrian road injuries, motor vehicle road injuries, conflict and terrorism, etc.) for age-
9
10 200 standardized incidence rates of TBI and SCI in 204 countries and territories in 2019, and we
11
12
13 201 also analyzed trends in age-standardized incidence rates of TBI and SCI caused by the most
14
15
16 202 common causes in the corresponding countries and territories from 1990 to 2019 (except three
17
18 203 causes: conflict and terrorism, exposure to forces of nature, and executions and police
19
20
21 204 conflict, which were considered as fatal discontinuities and defined as random events due to
22
23
24 205 not having predictable time trends in the GBD 2019 study [5]). More details about definitions
25
26 206 of causes and corresponding ICD-9/ICD-10 codes had already been described elsewhere [5].
27
28
29 207 Fourthly, based on one prior GBD study by GBD 2019 Fracture Collaborators [14], we
30
31 208 reported the top three countries and territories with age-standardized incidence rates caused
32
33
34 209 by each cause, and the top three countries and territories with both the largest increase and the
35
36 210 largest decrease to explore potential reasons for their cause-specific disease burden. Finally,
37
38
39 211 considering that the data was non-normal distributed (Shapiro-Wilk test had a p-value equal
40
41
42 212 to <0.001), the associations between Socio-demographic Index (SDI, a composite indicator of
43
44 213 income per capita, years of schooling, and fertility rate; SDI ranges from 0 to 1 in the GBD
45
46
47 214 2019 study, where 0 represents the lowest income per capita, the fewest years of schooling,
48
49
50 215 and the highest fertility rate, and vice versa [5], **eTable 6**) and the age-standardized YLD rates
51
52 216 in 204 countries and territories in 2019 were analyzed by Spearman correlation tests to
53
54
55 217 examine the effect of SDI on the disease burden [15-17]. All statistical analyses and figures
56
57 218 drawing were conducted in R program (version 4.1.3) and GraphPad Prism (version 7.0.0).
58
59
60

1
2
3 219 Statistical significance was defined as two-tailed $P < 0.05$.

4
5 220

6
7
8 221 **Patient and Public Involvement statement**

9
10 222

11
12
13 223 The data used in this study was publicly available and did not contain any independently
14
15 224 identifiable information. Therefore, no ethical approval or patient consent was required for
16
17
18 225 this study.

19
20
21 226

22
23 227 **Results**

24
25
26 228

27
28
29 229 **Global, Regional, and National Disease Burden**

30
31 230

32
33
34 231 Globally, traumatic brain injury (TBI) had 27.16 (95% uncertainty interval [UI], 23.36 to
35
36 232 31.42) million new cases, 48.99 (46.84 to 51.32) million prevalent cases, and 7.08 (5.00 to
37
38 233 9.59) million years lived with disability (YLDs) in 2019 (**Table 1; eTable 7**). There were 346
39
40 234 (95% UI, 298 to 401) cases per 100,000 population, 599 (573 to 627) cases per 100,000
41
42 235 population, and 87 (61 to 117) YLDs per 100,000 population for age-standardized incidence
43
44 236 rates, age-standardized prevalence estimates, and age-standardized YLD rates of TBI in 2019,
45
46
47 237 respectively. Global age-standardized incidence rates of TBI decreased significantly by -5.5%
48
49 238 (95% UI, -8.9% to -3.0%) from 1990 to 2019 (**eTable 8**). By contrast, there was no
50
51
52 239 significant change in global age-standardized incidence rates of spinal cord injury (SCI, -6.1%
53
54
55 240 [-17.3% to 1.5%]) from 1990 to 2019 (**Table 2; eTables 9-10**). Global absolute numbers and
56
57
58
59
60

1
2
3 241 age-standardized rates/estimates of incidence, prevalence, and YLD of SCI can be found in
4
5 242 Ding et al [6].
6
7

8 243
9
10 244 Regionally, Eastern Europe had the largest age-standardized incidence rates (737 [633 to 857]
11
12 245 cases per 100,000 population), age-standardized prevalence estimates (1312 [1240 to 1393]
13
14 246 cases per 100,000 population), and age-standardized YLD rates (193 [136 to 261] YLDs per
15
16 247 100,000 population) of TBI in 2019. Regional burden of SCI has been described by Ding et al
17
18 248 [6].
19
20
21
22

23 249
24
25 250 Nationally, for TBI, Slovenia had the largest age-standardized incidence rates (885 [768 to
26
27 251 1036] cases per 100,000 population), age-standardized prevalence estimates (1521 [1448 to
28
29 252 1595] cases per 100,000 population), and age-standardized YLD rates (223 [157 to 303]
30
31 253 YLDs per 100,000 population) in 2019 (**Figure 1; eFigures 1-3**). For SCI, Afghanistan had
32
33 254 the largest age-standardized incidence rates (44 [12 to 132] cases per 100,000 population),
34
35 255 and Syrian Arab Republic had the largest age-standardized prevalence estimates (1049 [333 to
36
37 256 2942] cases per 100,000 population) and age-standardized YLD rates (403 [113 to 1150]
38
39 257 YLDs per 100,000 population) in 2019 (**Figure 1; eFigures 4-6**).

47 258

48 49 259 **Leading Causes by Country and Territory**

50
51
52 260

53
54
55 261 Considering the cause-specific age-standardized incidence rates of TBI in 2019, falls was the
56
57 262 most common cause in 74% (150/204) of countries and territories, followed by pedestrian
58
59
60

1
2
3 263 road injuries (14%, 29/204), motor vehicle road injuries (5%, 11/204), and conflict and
4
5 264 terrorism (2%, 4/204) (**Figure 2; eTable 11**). The top three countries and territories with age-
6
7
8 265 standardized incidence rates by falls were Finland (418 [324 to 539] cases per 100,000
9
10 266 population), Slovenia (401 [320 to 504] cases per 100,000 population), and Croatia (400 [318
11
12
13 267 to 501] cases per 100,000 population) (out of 150 countries and territories), by pedestrian road
14
15
16 268 injuries were Mozambique (103 [76 to 134] cases per 100,000 population), Ghana (83 [61 to
17
18 269 109] cases per 100,000 population), and Guinea-Bissau (71 [50 to 95] cases per 100,000
19
20
21 270 population) (out of 29 countries and territories), by motor vehicle road injuries were Comoros
22
23
24 271 (86 [61 to 117] cases per 100,000 population), Mauritania (79 [56 to 109] cases per 100,000
25
26 272 population), and Cameroon (75 [52 to 103] cases per 100,000 population) (out of 11 countries
27
28
29 273 and territories), and by conflict and terrorism were Afghanistan (356 [134 to 798] cases per
30
31 274 100,000 population), Yemen (256 [103 to 590] cases per 100,000 population), and Syrian
32
33
34 275 Arab Republic (180 [68 to 394] cases per 100,000 population) (out of 4 countries and
35
36 276 territories) (**Figure 3**).

37
38
39 277
40
41
42 278 By falls, the countries and territories with the top three largest increase in age-standardized
43
44 279 incidence rates of TBI from 1990 to 2019 were Turkey (100.3% [88.8% to 114.5%]), Bhutan
45
46
47 280 (96.7% [86.9% to 108.0%]), and Cambodia (73.5% [67.6% to 79.9%]), and the top three
48
49
50 281 decreasing rates were in Democratic People's Republic of Korea (-38.1% [-40.2% to -
51
52 282 35.8%]), Armenia (-35.1% [-41.2% to -28.4%]), and Latvia (-34.6% [-38.4% to -30.9%]) (out
53
54
55 283 of 150 countries and territories). By pedestrian road injuries, the top three countries and
56
57 284 territories by increasing rates were Lesotho (49.5% [38.4% to 59.9%]), Cabo Verde (28.1%

1
2
3 285 [19.2% to 37.2%]), and Ghana (18.3% [11.2% to 26.6%]), and the top three countries and
4
5 286 territories by decreasing rates were Zimbabwe (-32.5% [-38.5% to -26.4%]), Rwanda (-30.3%
6
7
8 287 [-34.9% to -25.3%]), and South Sudan (-19.2% [-24.3% to -13.9%]) (out of 29 countries and
9
10 288 territories). By motor vehicle road injuries, the countries and territories with the top three
11
12
13 289 largest increase in rates were Dominican Republic (38.5% [24.0% to 54.6%]), Sao Tome and
14
15
16 290 Principe (28.9% [20.0% to 38.6%]), and Seychelles (26.8% [15.3% to 39.3%]), and there
17
18 291 were only two countries and territories had a significant decrease in their rates: South Africa
19
20
21 292 (-26.0% [-30.5% to -21.3%]) and Mauritania (-11.2% [-17.4% to -4.2%]) (amongst the 11
22
23
24 293 included countries and territories).

25
26 294

27
28
29 295 For SCI, falls was the most common cause for age-standardized incidence rates in 97%
30
31 296 (198/204) of countries and territories in 2019, followed by conflict and terrorism (3%, 6/204)
32
33
34 297 (**eTable 12**). The top three countries and territories with age-standardized incidence rates by
35
36 298 falls were Greenland (23 [15 to 34] cases per 100,000 population), Norway (21 [14 to 33]
37
38
39 299 cases per 100,000 population), and Sweden (19 [12 to 29] cases per 100,000 population) (out
40
41
42 300 of 198 countries and territories), and by conflict and terrorism were Afghanistan (40 [8 to
43
44 301 128] cases per 100,000 population), Yemen (22 [5 to 66] cases per 100,000 population), and
45
46
47 302 Syrian Arab Republic (21 [4 to 64] cases per 100,000 population) (out of 6 countries and
48
49
50 303 territories).

51
52 304

53
54
55 305 Regarding change rates in falls (as a cause of SCI) from 1990 to 2019, the countries and
56
57 306 territories with the largest increase in age-standardized incidence rates were Turkey (110.5%
58
59
60

1
2
3 307 [97.3% to 125.4%]), Bhutan (101.1% [90.9% to 112.6%]), and Cambodia (76.5% [70.1% to
4
5 308 83.1%]), and the top largest declines were in Democratic People's Republic of Korea (-37.2%
6
7
8 309 [-39.3% to -34.9%]), Latvia (-34.5% [-37.9% to -31.0%]), and Armenia (-33.9% [-39.3% to -
9
10 310 27.9%]) (out of 198 countries and territories).

311

312 **Disease Burden by Socio-demographic Index**

313

314 Generally, a positive association was found between age-standardized YLD rates of TBI and
315 Socio-demographic Index (SDI) in 204 countries and territories in 2019 ($\rho=0.42$, $P<.001$)
316 (**eFigure 7**). The observed rates higher than the expected were found not only in countries and
317 territories with higher SDI, such as Australia, but also in countries and territories with lower
318 SDI, such as Afghanistan. SCI on the other hand, had no statistical association with SDI ($\rho=-$
319 0.05 , $P=0.49$), although the SCI burden in a few countries and territories, such as Afghanistan,
320 far exceeded those of others.

321

322 **Discussion**

323

324 This study provided the most up-to-date burden of TBI and SCI through the GBD 2019 data.
325 It also presented the variations between the leading causes of TBI and SCI in 204 individual
326 countries and territories. Besides, the associations between national SDI and the burden of
327 TBI and SCI were explored.

328

1
2
3 329 Globally, we found that the age-standardized incidence rates of TBI had a significant decrease
4
5 330 since 1990. This may reflect the benefits of global initiatives to reduce rates of TBI. Major
6
7
8 331 efforts have included a focus on road safety and reduced road related injuries, a leading cause
9
10 332 of TBI globally [18]. One example, was in 2004, when the United Nations General Assembly
11
12
13 333 and World Health Organization passed resolutions which called on preventive measures
14
15
16 334 against road injuries [19]. The resolutions were championed in many countries and territories
17
18 335 successively, including Oman, Russia, and Sweden [19]. When looking at Oman, Russia, and
19
20
21 336 Sweden, their age-standardized incidence rates of TBI decreased significantly with percentage
22
23
24 337 changes of -7.2% (-11.9% to -2.0%), -20.3% (-22.5% to -17.9%), and -9.8% (-13.6% to -
25
26 338 5.4%) from 1990 to 2019, respectively, demonstrating effectiveness of their interventions.
27
28
29 339 Unfortunately, despite the significant decreases observed in TBI, the global age-standardized
30
31 340 incidence rates of SCI had no significant change. However, this is different from Ding et al.'s
32
33
34 341 conclusion that the global age-standardized incidence rates of SCI had decreased since 1990,
35
36 342 with an estimated annual percentage change (EAPC) of -0.08 (95% UI, -0.24 to 0.09) [6].
37
38
39 343 This misinterpretation of the statistical result neglecting uncertainty intervals and focusing
40
41 344 only on point estimates may cause confusions and bring biased information to health care
42
43
44 345 professionals [20]. In this study, the insignificant change in the global age-standardized
45
46
47 346 incidence rates of SCI may be related to motor vehicle accidents not being a major cause of
48
49
50 347 SCI, in the same way it is for TBI [21, 22]. Health care professionals should therefore
51
52 348 prioritize falls reduction in attempts to reduce the rates of SCI and TBI.
53
54
55 349

1
2
3 350 One challenge in any global effort to reduce falls is the ageing population, with 9.1% of the
4
5 351 global population over the age of 65 in 2019, compared with 6.2% in 1990 [23]. Falls are
6
7
8 352 more common in the elderly, owing to sarcopenia, osteoporosis, sleeping disturbance,
9
10 353 multimorbidity, and frailty [13]. In countries and territories with high age-standardized
11
12
13 354 incidence rates of TBI and SCI by falls, such as, Finland, Slovenia, Croatia, Norway, and
14
15
16 355 Sweden, the percentages of the population over the age of 65 were 22.1%, 20.2%, 20.9%,
17
18 356 17.3%, and 20.2% in 2019, respectively, far exceeding the world average (9.1%) [23].
19
20
21 357 Additional challenges to falls reduction is not just the ageing population, but the increased
22
23
24 358 global life expectancy at birth from 65.4 years in 1990 to 73.5 years in 2019 [12]. With an
25
26 359 older population, that is living longer, falls is likely to remain a high-priority area for health
27
28
29 360 care professionals [24]. Although some components of falls are modifiable, some countries
30
31
32 361 and territories have unique challenges, due to their geographical features. Finland, Norway,
33
34 362 and Sweden for example, all have cold climates and unique environmental risk factors (i.e.,
35
36 363 icy sidewalks), which may increase their populations chances of a fall [25, 26]. In these
37
38
39 364 countries and territories, increased focus on environmental risks may need to be prioritized,
40
41
42 365 particularly as their population continue to age.

43
44 366
45
46
47 367 Looking at changes in age-standardized incidence rates by falls, Turkey had the largest
48
49
50 368 increase (TBI: 100.3% [88.8% to 114.5%], SCI: 110.5% [97.3% to 125.4%]), but Armenia
51
52 369 had a significant decrease in both TBI (-35.1% [-41.2% to -28.4%]) and SCI (-33.9% [-39.3%
53
54 370 to -27.9%]) from 1990 to 2019. The reasons for this change were unknown, but may be
55
56
57 371 related to changes in resource allocation. In Armenia, increases from \$2.26 billion in 1990 to
58
59
60

1
2
3 372 \$13.86 billion in 2019 in its Gross Domestic Product (GDP, current US\$) have led to its
4
5 373 increased spending on healthcare so that it may improve public healthcare education [27-29].
6
7
8 374 By contrast, Turkey has faced economic difficulty in recent years, with its GDP decreasing
9
10 375 from \$957.78 billion in 2013 to \$761 billion in 2019, which may have contributed to the
11
12
13 376 significant increase in identified in this study [29].
14
15

16 377

17
18 378 Road injuries was found to be the leading cause of TBI in 20% (40/204) of countries and
19
20
21 379 territories, with a higher prevalence identified in African countries and territories. One
22
23
24 380 possible reason for the high prevalence in Africa may be the combination of a rapid increase
25
26 381 in motor vehicle ownership [30], without sufficient road infrastructure to support it (i.e., roads
27
28 382 and traffic safety) [31-34]. In African countries and territories, such as Mozambique, a
29
30
31 383 previous study found concerns with non-adherence to traffic regulations, poorly maintained
32
33
34 384 roads, inadequate traffic signage, and a lack of pedestrian protections as possible reasons
35
36 385 behind Mozambique's high age-standardized incidence rates of TBI [35]. A lack of sufficient
37
38
39 386 safety around motor vehicles is not limited to Africa however, with the Dominican Republic
40
41
42 387 also recording a high age-standardized incidence rates of TBI, and this was also attributed to
43
44 388 traffic safety, although the reasons were reported as high rates of people driving while
45
46
47 389 intoxicated, and limited policing of traffic violations [36]. The high burden of TBI by road
48
49
50 390 injuries in these countries and territories demonstrates that despite some countries and
51
52 391 territories having successfully reduced their road injuries, challenges remain in others.
53
54
55 392 Furthermore, the variations in causes and rates of TBI identified in this study suggest that
56
57 393 global initiatives to reducing rates of motor vehicle accidents or TBI need to consider the
58
59
60

394 unique challenges faced by each country and territory, rather than a generalist approach to rate
395 reduction [19].

396

397 Finally, conflict and terrorism was the most common cause of TBI and SCI in 2% (4/204) and
398 3% (6/204) of countries and territories, respectively, such as Afghanistan, Yemen, and Syrian
399 Arab Republic, which are likely attributable to the on-going armed conflicts that have
400 occurred in these countries and territories over many years [37-39]. It also suggests the
401 importance of an appeal for peace in these war-torn countries and territories.

402

403 This study had some strengths. Firstly, it provided the most up-to-date global, regional, and
404 national burden of TBI and SCI from 1990 to 2019. The findings can help health care
405 professionals acquire the most up-to-date epidemiological characteristics of TBI and SCI in
406 21 GBD regions and 204 countries/territories. Secondly, it presented the variations of leading
407 causes in 204 different countries and territories, which can help health care professionals
408 identify which causes should be targeted in different countries/territories to improve the
409 effectiveness of preventive interventions.

410

411 This study also had similar limitations to other GBD studies. Firstly, the results of some data-
412 sparse countries and territories (e.g., Democratic People's Republic of Korea, Bhutan, etc.)
413 should be interpreted carefully. In the future, we hope that more comprehensive
414 epidemiological data will be available for these countries and territories, to help improve
415 confidence in the results. Secondly, the data sources relied on patients having medical

1
2
3 416 records, which may have underestimated the burden of some conditions. In mild TBI for
4
5 417 example, some patients may not seek medical help, and would therefore not be included in
6
7
8 418 overall rates of TBI. Thirdly, some patients can experience both TBI and SCI from a
9
10 419 traumatic event, because SCI had a higher rank than TBI in the GBD severity hierarchy that
11
12
13 420 we utilized in this study, SCI would be matched to the individual, which may cause some
14
15
16 421 underestimation of the burden of TBI. Finally, the GBD study did not link risk factors, such
17
18 422 as behavioral factors (e.g., speeding, alcohol use, etc.), with TBI and SCI [40], so we were
19
20
21 423 unable to assess any associations between the two. In the future, we hope that the GBD study
22
23
24 424 will include this information, to help provide more detailed results on the causes of TBI and
25
26 425 SCI and in-turn allow for more targeted preventative strategies [41].
27
28
29 426

30 31 427 **Conclusions** 32 33 34 428

35
36 429 In conclusion, we found that global age-standardized incidence rates of TBI had a significant
37
38
39 430 decrease since 1990, whereas SCI had no significant change. Falls was the leading cause of
40
41
42 431 TBI and SCI in 74% (150/204) and 97% (198/204) of countries and territories, respectively,
43
44
45 432 but the variations of leading causes of TBI and SCI did exist between countries and territories,
46
47 433 even within a same geographic region. Although declining, high burden of TBI remained a
48
49
50 434 concern in both higher and lower SDI countries and territories. High burden of SCI from falls
51
52 435 in almost all countries and territories demonstrates the need for falls reduction to be a global
53
54
55 436 priority now and into the future, but priorities may vary between countries and territories.

GATHER checklist of information that should be included in new reports of global health
STROBE Statement—Checklist of items that should be included in reports of **cross-sectional studies**

eFigure 1. Incidence of traumatic brain injury worldwide

eFigure 2. Prevalence of traumatic brain injury worldwide

eFigure 3. Years lived with disability of traumatic brain injury worldwide

eFigure 4. Incidence of spinal cord injury worldwide

eFigure 5. Prevalence of spinal cord injury worldwide

eFigure 6. Years lived with disability of spinal cord injury worldwide

eFigure 7. Associations between Socio-demographic Index (SDI) and age-standardized years lived with disability (YLDs) rates of traumatic brain injury and spinal cord injury in 204 countries and territories

eTable 1. Global Burden of Disease severity hierarchy for nature-of-injury

eTable 2. Global Burden of Disease lay descriptions and disability weights for health states

eTable 3. Global Burden of Disease (GBD) location hierarchy: 7 GBD super regions, 21 GBD regions, and 204 countries and territories

eTable 4. Global Burden of Disease world population standard

eTable 5. Global Burden of Disease (GBD) cause hierarchy with levels for injuries

eTable 6. Global Burden of Disease locational ISO3 code and Socio-demographic Index (SDI), 2019

eTable 7. Years lived with disability for 2019 and percentage changes of age-standardized rates by location for traumatic brain injury, 1990–2019

eTable 8. Incidence, prevalence, and years lived with disability for 1990 by location for traumatic brain injury

eTable 9. Years lived with disability for 2019 and percentage changes of age-standardized rates by location for spinal cord injury, 1990–2019

eTable 10. Incidence, prevalence, and years lived with disability for 1990 by location for spinal cord injury

Checklist of information that should be included in new reports of global health estimates

Item #	Checklist item	Reported on page #
Objectives and funding		
1	Define the indicator(s), populations (including age, sex, and geographic entities), and time period(s) for which estimates were made.	Main Pg. 4-8
2	List the funding sources for the work.	Main Pg. 18
Data Inputs		
<i>For all data inputs from multiple sources that are synthesized as part of the study:</i>		
3	Describe how the data were identified and how the data were accessed.	Main Pg. 4-8
4	Specify the inclusion and exclusion criteria. Identify all ad - hoc exclusions.	Main Pg. 4-5 https://ghdx.healthdata.org/gbd-2019/data-input-sources
5	Provide information on all included data sources and their main characteristics. For each data source used, report reference information or contact name/institution, population represented, data collection method, year(s) of data collection, sex and age range, diagnostic criteria or measurement method, and sample size, as relevant.	Main Pg. 4-5 https://ghdx.healthdata.org/gbd-2019/data-input-sources
6	Identify and describe any categories of input data that have potentially important biases (e.g., based on characteristics listed in item 5).	https://ghdx.healthdata.org/gbd-2019/data-input-sources https://ghdx.healthdata.org/gbd-2019/code
<i>For data inputs that contribute to the analysis but were not synthesized as part of the study:</i>		
7	Describe and give sources for any other data inputs.	N/A
<i>For all data inputs:</i>		
8	Provide all data inputs in a file format from which data can be efficiently extracted (e.g., a spreadsheet rather than a PDF), including all relevant meta - data listed in item 5. For any data inputs that cannot be shared because of ethical or legal reasons, such as third - party ownership, provide a contact name or the name of the institution that retains the right to the data.	https://ghdx.healthdata.org/gbd-2019/data-input-sources
Data analysis		
9	Provide a conceptual overview of the data analysis method. A diagram may be helpful.	Main Pg. 7-8

10	Provide a detailed description of all steps of the analysis, including mathematical formulae. This description should cover, as relevant, data cleaning, data pre - processing, data adjustments and weighting of data sources, and mathematical or statistical model(s).	Main Pg. 7-8 https://ghdx.healthdata.org/gbd-2019/code
11	Describe how candidate models were evaluated and how the final model(s) were selected.	N/A
12	Provide the results of an evaluation of model performance, if done, as well as the results of any relevant sensitivity analysis.	N/A
13	Describe methods for calculating uncertainty of the estimates. State which sources of uncertainty were, and were not, accounted for in the uncertainty analysis.	Main Pg. 6
14	State how analytic or statistical source code used to generate estimates can be accessed.	https://ghdx.healthdata.org/gbd-2019/code
Results and Discussion		
15	Provide published estimates in a file format from which data can be efficiently extracted.	https://vizhub.healthdata.org/gbd-results/
16	Report a quantitative measure of the uncertainty of the estimates (e.g. uncertainty intervals).	Main Pg. 8-12
17	Interpret results in light of existing evidence. If updating a previous set of estimates, describe the reasons for changes in estimates.	Main Pg. 12-17
18	Discuss limitations of the estimates. Include a discussion of any modelling assumptions or data limitations that affect interpretation of the estimates.	Main Pg. 16-17

This checklist should be used in conjunction with the GATHER statement and Explanation and Elaboration document, found on gather-statement.org

STROBE Statement—Checklist of items that should be included in reports of *cross-sectional studies*

	Item No	Recommendation	Page No
Title and abstract	1	(a) Indicate the study's design with a commonly used term in the title or the abstract	Main Pg. 1-2
		(b) Provide in the abstract an informative and balanced summary of what was done and what was found	Main Pg. 1-2
Introduction			
Background/rationale	2	Explain the scientific background and rationale for the investigation being reported	Main Pg. 2-3
Objectives	3	State specific objectives, including any prespecified hypotheses	Main Pg. 3
Methods			
Study design	4	Present key elements of study design early in the paper	Main Pg. 4
Setting	5	Describe the setting, locations, and relevant dates, including periods of recruitment, exposure, follow-up, and data collection	Main Pg. 5 https://ghdx.healthdata.org/gbd-2019/data-input-sources
Participants	6	(a) Give the eligibility criteria, and the sources and methods of selection of participants	Main Pg. 5 https://ghdx.healthdata.org/gbd-2019/data-input-sources
Variables	7	Clearly define all outcomes, exposures, predictors, potential confounders, and effect modifiers. Give diagnostic criteria, if	Main Pg. 5-6 https://vizhub.healthdata.org/gbd-results/

		applicable	
Data sources/ measurement	8*	For each variable of interest, give sources of data and details of methods of assessment (measurement). Describe comparability of assessment methods if there is more than one group	Main Pg. 5-6 https://vizhub.healthdata.org/gbd-results/
Bias	9	Describe any efforts to address potential sources of bias	https://ghdx.healthdata.org/gbd-2019/data-input-sources https://ghdx.healthdata.org/gbd-2019/code
Study size	10	Explain how the study size was arrived at	N/A
Quantitative variables	11	Explain how quantitative variables were handled in the analyses. If applicable, describe which groupings were chosen and why	Main Pg. 5-6 https://ghdx.healthdata.org/gbd-2019/code
Statistical methods	12	(a) Describe all statistical methods, including those used to control for confounding	Main Pg. 7-8 https://ghdx.healthdata.org/gbd-2019/code
		(b) Describe any methods used to examine subgroups and interactions	N/A
		(c) Explain how missing data were addressed	N/A
		(d) If applicable, describe analytical methods taking account of sampling strategy	N/A
		(e) Describe any sensitivity analyses	N/A
Results			
Participants	13*	(a) Report numbers of individuals at each stage of study—eg numbers potentially eligible,	https://ghdx.healthdata.org/gbd-2019/data-input-sources https://ghdx.healthdata.org/gbd-2019/code

		examined for eligibility, confirmed eligible, included in the study, completing follow-up, and analysed	
		(b) Give reasons for non-participation at each stage	https://ghdx.healthdata.org/gbd-2019/data-input-sources https://ghdx.healthdata.org/gbd-2019/code
		(c) Consider use of a flow diagram	https://ghdx.healthdata.org/gbd-2019/data-input-sources https://ghdx.healthdata.org/gbd-2019/code
Descriptive data	14*	(a) Give characteristics of study participants (eg demographic, clinical, social) and information on exposures and potential confounders	Main Pg. 8-12
		(b) Indicate number of participants with missing data for each variable of interest	N/A
Outcome data	15*	Report numbers of outcome events or summary measures	Main Pg. 8-12
Main results	16	(a) Give unadjusted estimates and, if applicable, confounder-adjusted estimates and their precision (eg, 95% confidence interval). Make clear which confounders were adjusted for and why they were included	Main Pg. 8-12
		(b) Report category boundaries when continuous variables were categorized	N/A
		(c) If relevant, consider translating estimates of relative risk into absolute	N/A

		risk for a meaningful time period	
Other analyses	17	Report other analyses done—eg analyses of subgroups and interactions, and sensitivity analyses	N/A
Discussion			
Key results	18	Summarise key results with reference to study objectives	Main Pg. 12-16
Limitations	19	Discuss limitations of the study, taking into account sources of potential bias or imprecision. Discuss both direction and magnitude of any potential bias	Main Pg. 16-17
Interpretation	20	Give a cautious overall interpretation of results considering objectives, limitations, multiplicity of analyses, results from similar studies, and other relevant evidence	Main Pg. 17
Generalisability	21	Discuss the generalisability (external validity) of the study results	Main Pg. 17
Other information			
Funding	22	Give the source of funding and the role of the funders for the present study and, if applicable, for the original study on which the present article is based	Main Pg. 18

*Give information separately for exposed and unexposed groups.

eFigure 1. Incidence of traumatic brain injury worldwide

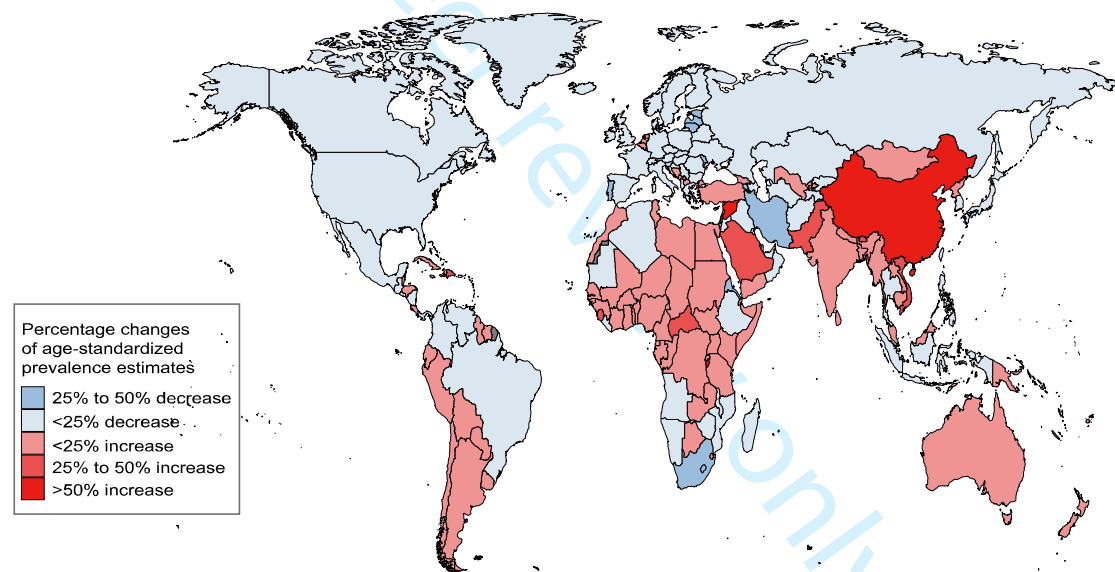

Percentage changes of age-standardized incidence rates of traumatic brain injury, 1990–2019

eFigure 2. Prevalence of traumatic brain injury worldwide

A

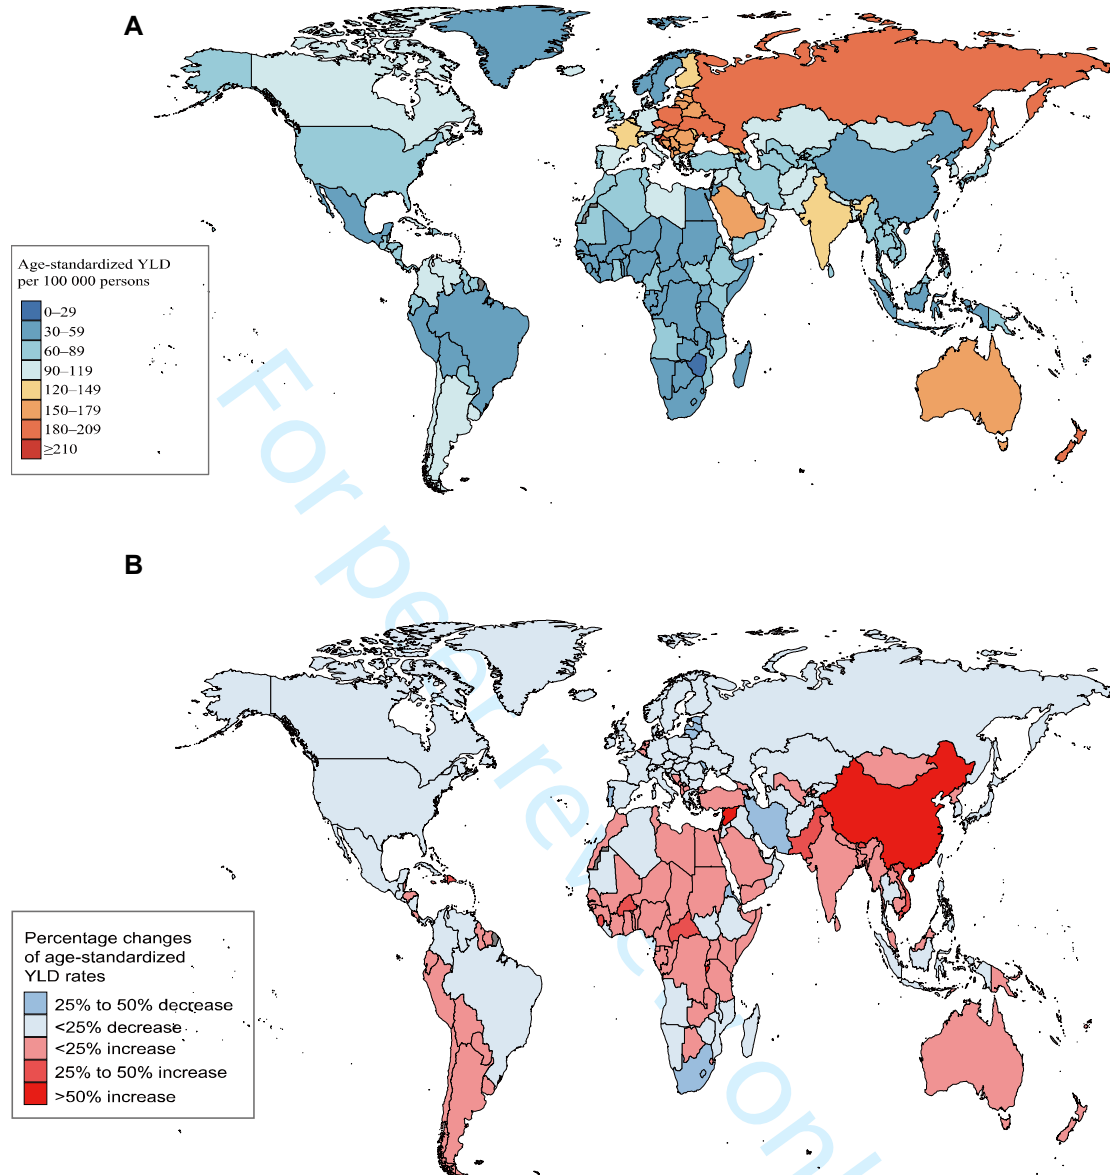

B

Age-standardized prevalence estimates per 100,000 persons of traumatic brain injury (TBI) by location, 2019 (A);

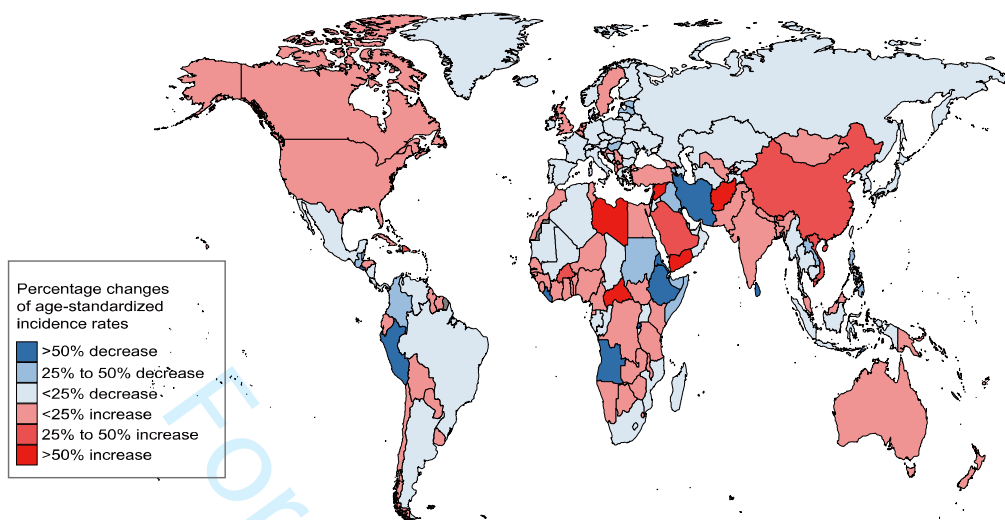

Percentage changes of age-standardized prevalence estimates of TBI, 1990–2019 (B)

eFigure 3. Years lived with disability of traumatic brain injury worldwide

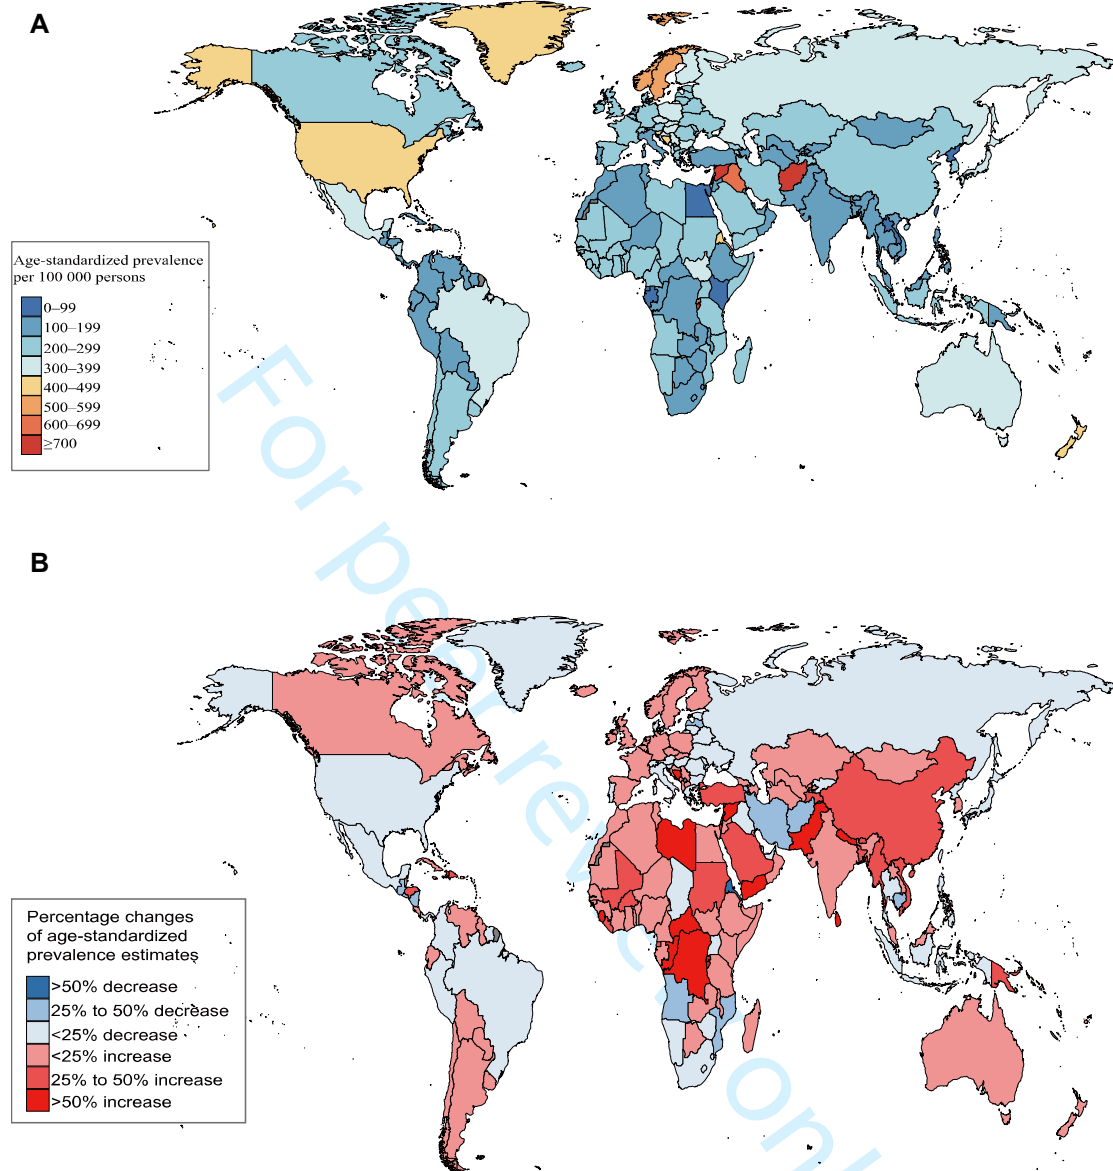

Age-standardized years lived with disability (YLDs) rates per 100,000 persons of traumatic brain injury (TBI) by location, 2019 (A); Percentage changes of age-standardized YLD rates of TBI, 1990–2019 (B)

eFigure 4. Incidence of spinal cord injury worldwide

Percentage changes of age-standardized incidence rates of spinal cord injury, 1990–2019

eFigure 5. Prevalence of spinal cord injury worldwide

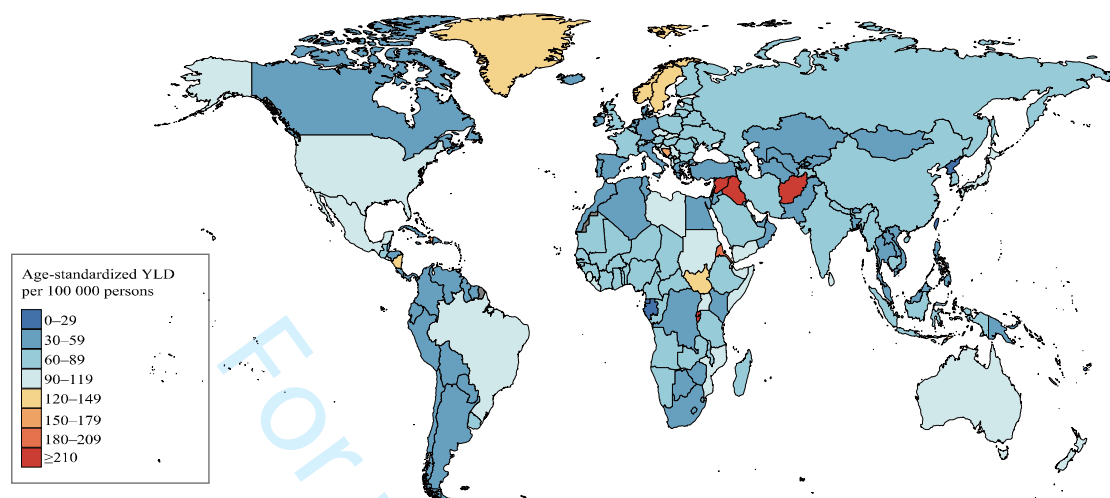

Age-standardized prevalence estimates per 100,000 persons of spinal cord injury (SCI) by location, 2019 (A);

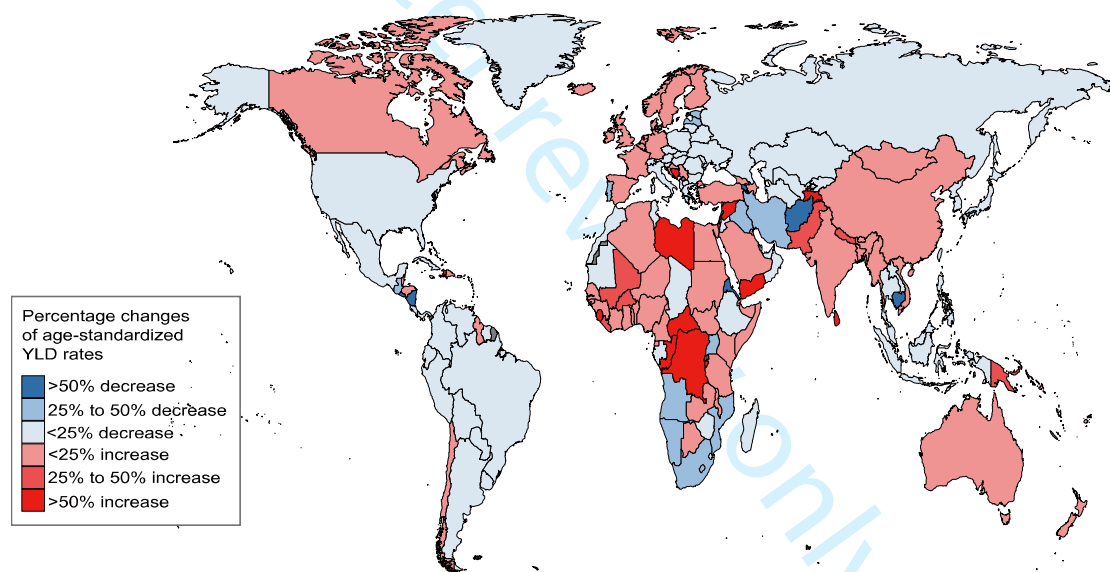

Percentage changes of age-standardized prevalence estimates of SCI, 1990–2019 (B)

eFigure 6. Years lived with disability of spinal cord injury world

A

B

Age-standardized years lived with disability (YLDs) rates per 100,000 persons of spinal cord injury (SCI) by location, 2019 (A); Percentage changes of age-standardized YLD rates of SCI, 1990–2019 (B)

eFigure 7. Associations between Socio-demographic Index (SDI) and age-standardized years lived with disability (YLDs) rates of traumatic brain injury and spinal cord injury in 204 countries and territories

Associations between Socio-demographic Index (SDI) and age-standardized years lived with disability (YLDs) rates of traumatic brain injury (A) and spinal cord injury (B) in 204 countries and territories, 2019; each point is plotted for each country/territory and shows observed age-standardized YLD rates for that country/territory in 2019; expected values based on SDI and disease rates in all countries and territories are shown as the black line; the name of each country/territory is represented by its ISO3 codes; ISO3 codes of 204 countries and territories are presented in **eTable 6**

6

eTable 1. Global Burden of Disease severity hierarchy for nature-of-injury

Rank	Inpatient hierarchy	Outpatient hierarchy
1	Spinal cord lesion below neck level	Fracture of pelvis
2	Amputation of lower limbs, bilateral	Fracture of patella, tibia or fibula, or ankle
3	Amputation of upper limbs, bilateral	Fracture of hip
4	Spinal cord lesion at neck level	Fracture of skull
5	Fracture of hip	Amputation of thumb
6	Fracture of femur, other than femoral neck	Fracture of vertebral column
7	Amputation of upper limb, unilateral	Multiple fractures, dislocations, crashes, wounds, sprains, and strains
8	Amputation of lower limb, unilateral	Internal hemorrhage in abdomen and pelvis
9	Multiple fractures, dislocations, crashes, wounds, sprains, and strains	Fracture of femur, other than femoral neck
10	Effect of different environmental factors	Dislocation of hip
11	Fracture of patella, tibia or fibula, or ankle	Amputation of toe/toes
12	Moderate-Severe traumatic brain injury	Fracture of hand (wrist and other distal part of hand)
13	Fracture of foot bones except ankle	Amputation of fingers (excluding thumb)
14	Internal hemorrhage in abdomen and pelvis	Burns, <20% of total burned surface area without lower airway burns
15	Crush injury	Dislocation of knee
16	Minor traumatic brain injury	Contusion in any part of the body
17	Fracture of pelvis	Minor traumatic brain injury
18	Nerve injury	Foreign body in respiratory system
19	Severe chest injury	Severe chest injury
20	Dislocation of hip	Drowning and nonfatal submersion
21	Burns, $\geq 20\%$ total burned surface area or $\geq 10\%$ burned surface area if head/neck or hands/wrist involved w/o lower airway burns	Asphyxiation
22	Lower airway burns	Poisoning requiring urgent care
23	Fracture of skull	Effect of different environmental factors
24	Amputation of thumb	Foreign body in GI and urogenital system
25	Fracture of hand (wrist and other distal part of hand)	Fracture of sternum and/or fracture of one or more ribs
26	Fracture of vertebral column	Nerve injury
27	Contusion in any part of the body	Fracture of face bones
28	Open wound(s)	Dislocation of shoulder

Rank	Inpatient hierarchy	Outpatient hierarchy
29	Amputation of toe/toes	Injury to eyes
30	Dislocation of knee	Fracture of clavicle, scapula, or humerus
31	Amputation of fingers (excluding thumb)	Fracture of radius and/or ulna
32	Drowning and nonfatal submersion	Fracture of foot bones except ankle
33	Asphyxiation	Foreign body in ear
34	Burns, <20% total burned surface area without lower airway burns	Muscle and tendon injuries, including sprains and strains lesser dislocations
35	Muscle and tendon injuries, including sprains and strains lesser dislocations	Superficial injury of any part of the body
36	Fracture of face bones	Open wound(s)
37	Foreign body in respiratory system	Complications following therapeutic procedures
38	Poisoning requiring urgent care	
39	Foreign body in GI and urogenital system	
40	Fracture of sternum and/or fracture of one or more ribs	
41	Dislocation of shoulder	
42	Injury to eyes	
43	Fracture of clavicle, scapula, or humerus	
44	Fracture of radius and/or ulna	
45	Foreign body in ear	
46	Superficial injury of any part of the body	
47	Complications following therapeutic procedures	

eTable 2. Global Burden of Disease lay descriptions and disability weights for health states

Health state	Lay description	Disability weight
Concussion	has headaches, dizziness, nausea and difficulty concentrating.	0.110 (0.074–0.158)
Severe traumatic brain injury: short term, with or without treatment	cannot concentrate and has headaches, memory problems, dizziness, and feels angry.	0.214 (0.141–0.297)
Traumatic brain injury: long-term consequences, minor, with or without treatment	has episodes of headaches, memory problems, and difficulty concentrating.	0.094 (0.063–0.133)
Traumatic brain injury: long-term consequences, moderate, with or without treatment	has frequent headaches, memory problems, difficulty concentrating, and dizziness. The person is often anxious and moody.	0.231 (0.156–0.324)
Traumatic brain injury: long-term consequences, severe, with or without treatment	cannot think clearly and has frequent headaches, memory problems, difficulty concentrating and dizziness. The person is often anxious and moody, and depends on others for feeding, toileting, dressing and walking.	0.637 (0.462–0.789)
Spinal cord lesion below neck: treated	is paralyzed from the waist down, cannot feel or move the legs and has difficulties with urine and bowel control. The person uses a wheelchair to move around.	0.296 (0.198–0.414)
Spinal cord lesion below neck: untreated	is paralyzed from the waist down, cannot feel or move the legs and has difficulties with urine and bowel control. Legs are in fixed, bent positions, and the person gets frequent infections and pressure sores.	0.623 (0.434–0.777)
Spinal cord lesion at neck: treated	is paralyzed from the neck down, with no feeling or control over any part of the body below the neck, and no urine or bowel control.	0.589 (0.415–0.748)
Spinal cord lesion at neck: untreated	is paralyzed from the neck down, with no feeling or control over any part of the body below the neck, and no urine or bowel control. Arms and legs are in fixed, bent positions, and the person gets frequent infections and pressure sores.	0.732 (0.544–0.871)

eTable 3. Global Burden of Disease (GBD) location hierarchy: 7 GBD super regions, 21 GBD regions, and 204 countries and territories

eTable 5. Global Burden of Disease (GBD) cause hierarchy with levels for injuries

Cause	Level
Injuries	1
Transport injuries	2
Road injuries	3
Pedestrian road injuries	4
Cyclist road injuries	4
Motorcyclist road injuries	4
Motor vehicle road injuries	4
Other road injuries	4
Other transport injuries	3
Unintentional injuries	2
Falls	3
Drowning	3
Fire, heat, and hot substances	3
Poisonings	3
Poisoning by carbon monoxide	4
Poisoning by other means	4
Exposure to mechanical forces	3
Unintentional firearm injuries	4
Other exposure to mechanical forces	4
Adverse effects of medical treatment	3
Animal contact	3
Venomous animal contact	4
Non-venomous animal contact	4
Foreign body	3
Pulmonary aspiration and foreign body in airway	4
Foreign body in eyes	4
Foreign body in other body part	4
Environmental heat and cold exposure	3
Exposure to forces of nature	3
Other unintentional injuries	3
Self-harm and interpersonal violence	2
Self-harm	3
Self-harm by firearm	4
Self-harm by other specified means	4
Interpersonal violence	3
Physical violence by firearm	4
Physical violence by sharp object	4
Physical violence by other means	4
Conflict and terrorism	3
Executions and police conflict	3

The 29 causes in **bold** (they were called the most detailed causes in the GBD 2019 study) were analyzed in our study, which was consistent with the statistical analysis in the previous GBD 2016 study published in The Lancet Neurology.

Table 7. Years lived with disability for 2019 and percentage changes of age-standardized rates by location for traumatic brain injury, 1990–2019

	YLDs		
	Numbers (95% UI) (2019)	Age-standardized rates per 100,000 (95% UI) (2019)	Percentage change of age-standardized rates (95% UI) (1990–2019)
Global	7076902 (4997948 to 9588098)	87 (61 to 117)	0.1% (-1% to 1.3%)
High-income	1360583 (957111 to 1837205)	88 (61 to 118)	-8.9% (-10.1% to -7.7%)
High-income North America	342093 (241165 to 461325)	69 (48 to 93)	-11.5% (-13% to -9.8%)
Canada	58904 (41426 to 79662)	107 (75 to 144)	-3.2% (-6.9% to 0.8%)
Greenland	37 (26 to 49)	56 (39 to 75)	-23.1% (-26.6% to -19.5%)
United States of America	283146 (199948 to 381051)	65 (45 to 87)	-13.5% (-15.1% to -11.9%)
Australasia	62658 (44000 to 84416)	166 (115 to 225)	2.2% (-0.7% to 5.4%)
Australia	51733 (36213 to 69985)	162 (112 to 220)	2.8% (-0.6% to 6.5%)
New Zealand	10925 (7716 to 14864)	187 (132 to 254)	0.8% (-2.2% to 4.3%)
High-income Asia Pacific	222787 (156099 to 301904)	76 (53 to 104)	-9.5% (-11.4% to -7.7%)
Brunei Darussalam	408 (287 to 557)	94 (67 to 128)	-13.9% (-17.4% to -10.5%)
Japan	131214 (91583 to 177340)	61 (43 to 83)	-16.3% (-17.7% to -14.9%)
Republic of Korea	84408 (58733 to 115371)	111 (78 to 152)	-8.5% (-12% to -4.9%)
Singapore	6757 (4714 to 9192)	92 (64 to 125)	-2.3% (-6.4% to 1.8%)
Western Europe	655051 (458429 to 881035)	100 (70 to 136)	-8.8% (-10.8% to -6.7%)
Andorra	153 (107 to 208)	126 (88 to 170)	1.5% (-2.4% to 5.6%)
Austria	14826 (10349 to 20156)	112 (78 to 151)	-12% (-15.6% to -8.1%)
Belgium	22555 (15827 to 30372)	132 (91 to 178)	4.9% (0.8% to 9.2%)
Cyprus	1721 (1213 to 2332)	104 (73 to 141)	1.7% (-3.1% to 6.2%)
Denmark	8047 (5630 to 10829)	99 (69 to 135)	-14.1% (-18% to -9.9%)

8 26 Global, regional, and national burden of traumatic brain injury and spinal cord injury, 1990–
9
10 27 2019: a systematic analysis for the Global Burden of Disease Study 2019
11
12
13 28

15
16 29 **Abstract**
17
18 30

21 31 **Objectives:** To evaluate the most up-to-date burden of traumatic brain injury (TBI) and spinal
22
23 32 cord injury (SCI) and analyze their leading causes in different countries/territories.
24
25
26 33

28
29 34 **Design:** An analysis of Global Burden of Disease (GBD) data.
30
31 35

33
34 36 **Setting:** The epidemiologic data were gathered from GBD Results Tool (January 1,
35
36 37 1990–December 31, 2019) covering 21 GBD regions and 204 countries/ territories.
38
39 38

41
42 39 **Participants:** Patients with TBI/SCI.
43
44 40

46
47 41 **Main outcomes and measures:** Absolute numbers and age-standardized rates/estimates of
48
49 42 incidence, prevalence, and years lived with disability (YLDs) of TBI/SCI by location in 2019,
50
51 43 with their percentage changes from 1990 to 2019. The leading causes (e.g., falls) of TBI/SCI
52
53 44 in 204 countries/territories.
54
55 45

56
57
58
59
60

1
2
3 46 **Results:** Globally, in 2019, TBI had 27.16 million new cases, 48.99 million prevalent cases,
4
5 47 and 7.08 million YLDs. SCI had 0.91 million new cases, 20.64 million prevalent cases, and
6
7 48 6.20 million YLDs. Global age-standardized incidence rates of TBI decreased significantly by
8
9 49 -5.5% (95% uncertainty interval, -8.9% to -3.0%) from 1990 to 2019, whereas SCI had no
10
11 50 significant change (-6.1% [-17.3% to 1.5%]). Regionally, in 2019, Eastern Europe and High-
12
13 51 income North America had the highest burden of TBI and SCI, respectively. Nationally, in
14
15 52 2019, Slovenia and Afghanistan had the highest age-standardized incidence rates of TBI and
16
17 53 SCI, respectively. For TBI, falls was the leading cause in 74% (150/204) of
18
19 54 countries/territories, followed by pedestrian road injuries (14%, 29/204), motor vehicle road
20
21 55 injuries (5%, 11/204), and conflict and terrorism (2%, 4/204). For SCI, falls was the leading
22
23 56 cause in 97% (198/204) of countries/territories, followed by conflict and terrorism (3%,
24
25 57 6/204).

26
27 58
28
29 59 **Conclusions:** Global age-standardized incidence rates of TBI have decreased significantly
30
31 60 since 1990, whereas SCI had no significant change. The leading causes of TBI/SCI globally
32
33 61 were falls, but variations did exist between countries/territories. Policymakers should continue
34
35 62 to prioritize interventions to reduce falls, but priorities may vary between countries/territories.
36
37 63

38 39 64 **Strengths and Limitations of This Study**

- 40
41 65
- 42 66 ● One of the strengths of this study was that it provided the most up-to-date global,
43
44 67 regional, and national burden of TBI/SCI from 1990 to 2019.
- 45
46
47
48
49
50
51
52
53
54
55
56
57
58
59
60

68

69 ● Another strength of this study was that it presented the variations of leading causes of
70 TBI/SCI in 204 countries/territories, which have not been assessed before.

71

72 ● One of the limitations was that this study might underestimate the true incidence and
73 prevalence of TBI/SCI.

74

75 ● The second limitation was that the estimates of TBI/SCI for some data-sparse
76 countries/territories in this study should be interpreted carefully.

77

78 ● The third limitation was that this study could not assess associations between risk factors
79 and TBI/SCI; calculate lifetime prevalence of TBI/SCI through the GBD data.

80

81

82 **Introduction**

83

84 Traumatic brain injury (TBI) and spinal cord injury (SCI) continue to pose challenges to the
85 global public health systems, and the resulting disabilities have brought huge economic
86 burden to patients, public health systems, and societies [1, 2]. Compared with the previous
87 Global Burden of Disease (GBD) 2016 Study [3, 4], new available data sources and improved
88 statistical methods in the GBD 2019 Study led to the GBD 2019 results superseding those

5

1
2
3 89 from previous rounds of GBD [5]. Besides, nine additional countries/territories were firstly
4
5 90 incorporated in the calculation of disease burden in the GBD 2019 Study [5]. An update on
6
7
8 91 the 2016 results of the burden of TBI/SCI is therefore warranted.
9

10 92
11
12
13 93 Ding *et al.* reported the burden of SCI at the global and regional levels through the GBD 2019
14
15 94 data, but did not mention the disease burden in individual countries/territories [6]. However, it
16
17 95 will not allow for identifying variations that can exist between countries/territories within a
18
19 96 same world or a same geographical region. Take the previous GBD 2016 Study as an
20
21 97 example, the leading cause of TBI in the region, North Africa and Middle East, was
22
23 98 concluded to be falls [4]. It was true in Saudi Arabia, whereas it did not reflect the reality in
24
25 99 other countries/territories within North Africa and Middle East, such as, Afghanistan, where
26
27 100 conflict and terrorism was the leading cause of TBI [4]. Failure to present the data in
28
29 101 individual countries/territories can prevent policymakers from identifying which causes
30
31 102 should be targeted; wasting resources and reducing effectiveness of any interventions [7].
32
33
34
35
36
37
38
39
40
41

42 104 Therefore, in this study, we aimed to provide the most up-to-date burden of TBI/SCI through
43
44 105 the GBD 2019 data. Also, we analyzed the leading causes of TBI/SCI in 204
45
46 106 countries/territories. Finally, the associations between the burden of TBI/SCI and Socio-
47
48 107 demographic Index (SDI) in 204 countries/territories was explored.
49
50

52 108

54 109 **Methods**

56
57 110
58
59
60

111 **Overview**

112

113 This study of global health estimates followed the Guidelines for Accurate and Transparent
114 Health Estimates Reporting (GATHER) Statement and the Strengthening the Reporting of
115 Observational Studies in Epidemiology (STROBE) Statement [8, 9]. The GBD 2019 Study
116 estimated burden of 369 diseases and injuries and 87 risk factors through multiple
117 epidemiological measures, including incidence, prevalence, mortality, years of life lost
118 (YLLs), years lived with disability (YLDs), and disability-adjusted life years (DALYs) by
119 age, sex, cause, year, and location from 1990 to 2019 [5]. Our methods used for estimation of
120 the burden of TBI and SCI were based on the framework of the GBD 2019 Study, which had
121 already been described comprehensively elsewhere [5, 10]. Although TBI/SCI could cause
122 death, they were not defined as a cause-of-death in the GBD 2019 Study [5]. Therefore, in
123 this study, we provided the burden of TBI/SCI by incidence, prevalence, and YLDs, but not
124 mortality or YLLs.

125

126 **Case Definitions**

127

128 Based on the framework of the GBD 2019 Study [5], the definitions of TBI/SCI in this study
129 relied on the International Classification of Diseases, Ninth Revision (ICD-9) and the
130 International Classification of Diseases, Tenth Revision (ICD-10), which had also been
131 described in details in the previous GBD 2016 Study published in The Lancet Neurology [4].
132 Additionally, a clarification from the GBD 2019 Study is that TBI/SCI are both defined as a

1
2
3 133 nature-of-injury but not a cause-of-injury [5]. For example, TBI/SCI could be caused by a
4
5 134 fall, the fall was therefore defined as a cause-of-injury and TBI/SCI as a nature-of-injury.
6
7

8 135

9
10 136 **Data Source**

11
12
13 137

14
15 138 The data for 21 GBD regions and 204 countries/territories between January 1, 1990, and
16
17
18 139 December 31, 2019, were available from the GBD Results Tool
19
20
21 140 (<https://vizhub.healthdata.org/gbd-results/>). The data utilized in this study were from patients
22
23
24 141 requiring medical care in hospital and emergency department records [5]. Furthermore,
25
26 142 compared with the GBD 2016 Study, new available data sources were incorporated into
27
28
29 143 estimates of non-fatal injuries in the GBD 2019 iteration, such as injury claims data from the
30
31
32 144 Accident Compensation Corporation in New Zealand, national survey data from China,
33
34 145 Ghana, India, Mexico, Russian Federation, and South Africa from the World Health
35
36
37 146 Organization's Study on Global AGEing and Adult Health, and literature studies data from
38
39
40 147 India and South Africa based on inputs from the GBD collaborator network [5]. Each data
41
42
43 148 source was assigned a unique identifier and included in the Global Health Data Exchange
44
45 149 (<https://ghdx.healthdata.org/gbd-2019/data-input-sources>). Additionally, considering that
46
47 150 there are variations in quality of data by each country and territory, estimates in some data-
48
49
50 151 sparse countries/territories were modelled and predicted by borrowing estimates from data-
51
52
53 152 rich countries/territories [5]. Detailed data sources used to estimate the burden of non-fatal
54
55 153 injuries from each country and territory were listed in **eTable 1**. More details of the data
56
57
58 154 sources and model strategies have been published elsewhere [5, 10].
59
60

155

156 Calculation of Incidence, Prevalence, and Years Lived with Disability

157

158 The features of data processing used to calculate incidence, prevalence, and YLDs in this
159 study were consistent with the framework of the GBD 2019 Study [5]. First, the data inputs of
160 different cause-of-injury were incorporated and modelled by a Bayesian meta-regression tool,
161 DisMod-MR 2.1, to infer the incidence of each cause-of-injury. Second, the GBD severity
162 hierarchy for nature-of-injury (**eTable 2**) was utilized to establish a point-to-point relationship
163 between cause-of-injury and nature-of-injury, which means that when multiple nature-of-
164 injuries were caused by one cause-of-injury, nature-of-injury with the highest rank in the
165 GBD severity hierarchy was selected to match it. Based on the framework of the GBD 2019
166 Study [5], because SCI had a higher rank in the GBD severity hierarchy than TBI, SCI was
167 chosen if both conditions happened to an individual in our study, which was also consistent
168 with the calculation process of the previous GBD 2016 Study published in The Lancet
169 Neurology [4]. Third, for the short-term disability (the duration was less than one year), the
170 prevalence was approximately calculated as the incidence multiplied by the average duration.
171 For the long-term disability (the duration was more than one year), DisMod-MR 2.1 was
172 utilized to convert incidence to prevalence. Fourth, the GBD disability weights (**eTable 3**)
173 were utilized to calculate YLDs. The GBD disability weights were evaluated on a 0–1 scale,
174 with 0 representing complete health and 1 representing death [11]. For the short-term
175 disability, YLDs were calculated as the prevalence multiplied by the GBD disability weights.
176 For the long-term disability, YLDs were calculated with the similar process but adjusted by

1
2
3 177 comorbidity correction. Finally, the incidence, prevalence, and YLDs were aggregated to
4
5 178 calculate the all-cause incidence, prevalence, and YLDs of TBI/SCI. Due to some sampling
6
7
8 179 errors and non-sampling variances, we calculated the 95% uncertainty interval (UI) using the
9
10
11 180 same methods described previously in the GBD 2019 Study [5]. Generally, UI were from
12
13 181 1,000 draw-level estimates for each parameter, and 95% UI were defined by the 25th and 975th
14
15
16 182 values of the ordered 1,000 estimates.

183

184 **Statistical Analysis**

185

186 Firstly, according to the GBD location hierarchy (**eTable 4**) in the GBD 2019 Study [5], we
187 calculated absolute numbers and age-standardized rates/estimates of incidence, prevalence,
188 and YLD of TBI/SCI in 21 GBD regions and 204 countries/territories in 2019. The age-
189 standardized rate/estimate is calculated by $\frac{\sum_{i=1}^A a_i w_i}{\sum_{i=1}^A w_i}$, where a_i is the age-specific rate/estimate
190 of the age group i , and w_i is the weight of the age group i derived from the GBD 2019 world
191 population standard (**eTable 5**) [12]. Secondly, based on the framework of the GBD 2019
192 Study [5], we used percentage changes of age-standardized rates/estimates of incidence,
193 prevalence, and YLD to calculate trends in the burden of TBI/SCI from 1990 to 2019. If the
194 95% UI of a percentage change did not include zero, it was determined to be a significant
195 change, and vice versa [13]. Thirdly, according to the GBD cause hierarchy (**eTable 6**) in the
196 GBD 2019 Study [5], we analyzed the leading causes (e.g., falls, pedestrian road injuries,
197 motor vehicle road injuries, conflict and terrorism, etc.) for age-standardized incidence rates
198 of TBI/SCI in 204 countries/territories in 2019, and we also analyzed trends in age-

1
2
3 199 standardized incidence rates of TBI/SCI caused by the leading causes in the corresponding
4
5 200 countries/territories from 1990 to 2019 (except three causes: conflict and terrorism, exposure
6
7
8 201 to forces of nature, and executions and police conflict, which were considered as fatal
9
10
11 202 discontinuities and defined as random events due to not having predictable time trends in the
12
13 203 GBD 2019 Study [5]). More details about definitions of causes and corresponding ICD-
14
15
16 204 9/ICD-10 codes had already been described elsewhere [5]. Fourthly, based on one prior GBD
17
18
19 205 paper by GBD Fracture Collaborators [14], we reported the top three countries/territories
20
21 206 with age-standardized incidence rates caused by each cause, and the top three
22
23
24 207 countries/territories with both the largest increase and the largest decrease to explore potential
25
26
27 208 reasons for their cause-specific disease burden. Finally, considering that the data was non-
28
29 209 normal distributed (Shapiro-Wilk test had a p-value equal to <0.001), the associations
30
31
32 210 between SDI (a composite indicator of income per capita, years of schooling, and fertility
33
34 211 rate; SDI ranges from 0 to 1 in the GBD 2019 Study, where 0 represents the lowest income
35
36
37 212 per capita, the fewest years of schooling, and the highest fertility rate, and vice versa [5],
38
39 213 **eTable 7**) and the age-standardized YLD rates in 204 countries/territories in 2019 were
40
41
42 214 analyzed by Spearman correlation tests to examine the effect of SDI on the disease burden
43
44
45 215 [15-17]. All statistical analyses and figures drawing were conducted in R program (version
46
47 216 4.1.3) and GraphPad Prism (version 7.0.0). Statistical significance was defined as two-tailed
48
49 217 $P<0.05$.

51
52 218

53 54 219 **Patient and Public Involvement Statement**

55
56
57 220
58
59
60

1
2
3 221 None.

4
5 222

6
7
8 223 **Results**

9
10 224

11
12
13 225 **Global, Regional, and National Disease Burden**

14
15
16 226

17
18 227 Globally, TBI had 27.16 (95% UI, 23.36 to 31.42) million new cases, 48.99 (46.84 to 51.32)

19
20 228 million prevalent cases, and 7.08 (5.00 to 9.59) million YLDs in 2019 (**Table 1; eTables 8-**

21
22 229 **10**). There were 346 (95% UI, 298 to 401) cases per 100,000 population, 599 (573 to 627)

23
24 230 cases per 100,000 population, and 87 (61 to 117) YLDs per 100,000 population for age-

25
26 231 standardized incidence rates, age-standardized prevalence estimates, and age-standardized

27
28 232 YLD rates of TBI in 2019, respectively (**Figure 1; eFigures 1-3**). SCI had 0.91 (0.71 to 1.16)

29
30 233 million new cases, 20.64 (18.93 to 23.61) million prevalent cases, and 6.20 (4.47 to 8.16)

31
32 234 million YLDs in 2019 (**Table 2; eTables 11-13**). There were 12 (9 to 15) cases per 100,000

33
34 235 population, 253 (231 to 290) cases per 100,000 population, and 76 (55 to 100) YLDs per

35
36 236 100,000 population for age-standardized incidence rates, age-standardized prevalence

37
38 237 estimates, and age-standardized YLD rates of SCI in 2019, respectively (**eFigures 4-6**).

39
40 238 Global age-standardized incidence rates of TBI decreased significantly by -5.5% (95% UI, -

41
42 239 8.9% to -3.0%) from 1990 to 2019. By contrast, there was no significant change in global age-

43
44 240 standardized incidence rates of SCI (-6.1% [-17.3% to 1.5%]) from 1990 to 2019. Regional

45
46 241 and national TBI/SCI burden were described in the **supplementary materials**.

47
48 242

243 **Leading Causes by Country and Territory**

244

245 Considering the cause-specific age-standardized incidence rates of TBI in 2019, falls was the
246 leading cause in 74% (150/204) of countries/territories, followed by pedestrian road injuries
247 (14%, 29/204), motor vehicle road injuries (5%, 11/204), and conflict and terrorism (2%,
248 4/204) (**Figure 2; eTable 14**). The top three countries/territories with age-standardized
249 incidence rates by falls were Finland (418 [324 to 539] cases per 100,000 population),
250 Slovenia (401 [320 to 504] cases per 100,000 population), and Croatia (400 [318 to 501]
251 cases per 100,000 population) (out of 150 countries/territories), by pedestrian road injuries
252 were Mozambique (103 [76 to 134] cases per 100,000 population), Ghana (83 [61 to 109]
253 cases per 100,000 population), and Guinea-Bissau (71 [50 to 95] cases per 100,000
254 population) (out of 29 countries/territories), by motor vehicle road injuries were Comoros (86
255 [61 to 117] cases per 100,000 population), Mauritania (79 [56 to 109] cases per 100,000
256 population), and Cameroon (75 [52 to 103] cases per 100,000 population) (out of 11
257 countries/territories), and by conflict and terrorism were Afghanistan (356 [134 to 798] cases
258 per 100,000 population), Yemen (256 [103 to 590] cases per 100,000 population), and Syrian
259 Arab Republic (180 [68 to 394] cases per 100,000 population) (out of 4 countries/territories)
260 (**Figure 3**).

261

262 For SCI, falls was the leading cause for age-standardized incidence rates in 97% (198/204) of
263 countries/territories in 2019, followed by conflict and terrorism (3%, 6/204) (**eTable 15**). The
264 top three countries/territories with age-standardized incidence rates by falls were Greenland

1
2
3 265 (23 [15 to 34] cases per 100,000 population), Norway (21 [14 to 33] cases per 100,000
4
5 266 population), and Sweden (19 [12 to 29] cases per 100,000 population) (out of 198
6
7
8 267 countries/territories), and by conflict and terrorism were Afghanistan (40 [8 to 128] cases per
9
10 268 100,000 population), Yemen (22 [5 to 66] cases per 100,000 population), and Syrian Arab
11
12
13 269 Republic (21 [4 to 64] cases per 100,000 population) (out of 6 countries/territories).
14
15
16 270 Percentage changes of cause-specific TBI/SCI burden were described in the **supplementary**
17
18 271 **materials**.

23 273 **Disease Burden by Socio-demographic Index**

24
25
26 274
27
28
29 275 Generally, a positive association was found between age-standardized YLD rates of TBI and
30
31 276 SDI in 204 countries/territories in 2019 ($\rho=0.42$, $P<.001$) (**eFigure 7**). SCI on the other hand,
32
33
34 277 had no statistical association with SDI ($\rho=-0.05$, $P=0.49$), although the SCI burden in a few
35
36 278 countries/territories, such as Afghanistan, far exceeded those of others.

41 280 **Discussion**

42
43
44 281
45
46
47 282 This study provided the most up-to-date burden of TBI and SCI using GBD 2019 data. It also
48
49 283 presented the variations between the leading causes of TBI/SCI in 204 countries/territories.

50
51
52 284 Finally, it explored the associations between each national SDI and the burden of TBI/SCI.

54 285 55 56 57 286 **Incidence of TBI/SCI**

1
2
3 287
4
5 288 Globally, the age-standardized incidence rates of TBI significantly decreased since 1990. This
6
7
8 289 improvement may reflect the benefits of global initiatives to reduce TBI rates. For example,
9
10 290 major efforts have focused on road safety and reduced road-related injuries, a leading cause of
11
12
13 291 TBI globally [18]. In 2004, the United Nations General Assembly and the World Health
14
15
16 292 Organization passed resolutions calling for preventive measures against road injuries [19].
17
18 293 The resolutions were championed in many countries/territories successively [19]. The age-
19
20
21 294 standardized TBI incidence rates decreased significantly from 1990 to 2019 by -7.2% (-11.9%
22
23
24 295 to -2.0%) in Oman, -20.3% (-22.5% to -17.9%) in Russia, and -9.8% (-13.6% to -5.4%) in
25
26 296 Sweden, demonstrating the effectiveness of their interventions.
27
28
29 297

30
31 298 Unfortunately, the global age-standardized SCI incidence rates did not significantly change
32
33
34 299 despite the decreases in TBI. Although we used the same GBD 2019 data, this conclusion
35
36 300 differs from Ding *et al.*'s finding that the global age-standardized incidence rates of SCI
37
38
39 301 decreased since 1990 [6]. Ding *et al.* calculated the temporal trends of the global age-
40
41
42 302 standardized incidence rates of SCI using the Estimated Annual Percentage Change (EAPC)
43
44 303 [6]. The EAPC was based on a linear regression mode of the age-standardized rates and the
45
46
47 304 calendar year [20]. However, EAPC can be biased in modeling injuries from natural disasters
48
49
50 305 or wars; if included, it inflates estimates in volatile regions [21]. Furthermore, Ding *et al.*
51
52 306 misinterpreted their statistical results [6]. The EAPC was -0.08 but had a 95% confidence
53
54
55 307 interval of -0.24 to 0.09 [6]. By focusing only on the point estimate of -0.08 and neglecting
56
57
58 308 the confidence interval, they failed to convey that the confidence interval crossed zero. That
59
60

1
2
3 309 approach may confuse and bring biased information to policymakers [22]. Our study showed
4
5 310 a non-significant change in the global age-standardized incidence rates of SCI (-6.1% [-17.3%
6
7
8 311 to 1.5%]). The lack of SCI change may be because motor vehicle accidents are a major cause
9
10 312 of TBI but not SCI. As discussed below, other interventions may be required to reduce SCI
11
12
13 313 [23, 24].

14
15
16 314

17 18 315 **Causes of TBI/SCI**

19
20
21 316

22
23 317 One challenge in any global effort to reduce falls is the aging population. The global
24
25 318 population over the age of 65 rose from 6.2% in 1990 to 9.1% in 2019 [25]. Falls are more
26
27
28 319 common in older than younger adults owing to sarcopenia, osteoporosis, sleeping disturbance,
29
30
31 320 multimorbidity, and frailty [13]. Several countries/territories with high age-standardized
32
33
34 321 incidence rates of TBI/SCI by falls also have percentages of older adults that far exceeds the
35
36 322 world average of 9.1% of the population. Examples include Finland (22.1% of the population
37
38
39 323 over the age of 65 in 2019), Slovenia (20.2%), Croatia (20.9%), Norway (17.3%), and
40
41
42 324 Sweden (20.2%) [25]. Although some components of falls are modifiable, some
43
44 325 countries/territories have unique challenges due to their geographical features. Finland,
45
46
47 326 Norway, and Sweden have cold climates and unique environmental risk factors (i.e., icy
48
49
50 327 sidewalks) that may increase their populations' fall risk [26, 27]. Environmental risks may
51
52 328 need to be prioritized in these countries/territories, particularly as their populations age.

53
54
55 329
56
57
58
59
60

1
2
3 330 This study also examined changes in age-standardized incidence rates by falls. Turkey had the
4
5 331 largest increases from 1990 to 2019 (TBI: 100.3% [88.8% to 114.5%], SCI: 110.5% [97.3%
6
7
8 332 to 125.4%]). Armenia had a significant decrease in both TBI (-35.1% [-41.2% to -28.4%])
9
10 333 and SCI (-33.9% [-39.3% to -27.9%]). The reasons for this change were unknown but may be
11
12 334 related to changes in resource allocation. The gross domestic product (GDP, current USD) in
13
14 335 Armenia increased from \$2.26 billion in 1990 to \$13.86 billion in 2019, leading to increased
15
16 336 healthcare spending that may have improved public healthcare education [28-30]. By contrast,
17
18 337 Turkey faced economic difficulty in recent years; its GDP decreased from \$957.78 billion in
19
20 338 2013 to \$761 billion in 2019, which may have contributed to the significant increases in this
21
22 339 study [30].
23
24
25
26
27
28
29
30

31 341 Road injuries were the leading cause of TBI in 20% (40/204) of the countries/territories.
32
33 342 There was a higher prevalence in African countries/territories. One possible reason for the
34
35 343 high prevalence in Africa may be the rapid increase in motor vehicle ownership [31], without
36
37 344 sufficient road infrastructure (i.e., roads and traffic safety) [32-35]. A previous study found
38
39 345 non-adherence to traffic regulations, poorly maintained roads, inadequate traffic signage, and
40
41 346 a lack of pedestrian protections as possible reasons behind Mozambique's high age-
42
43 347 standardized incidence rates of TBI [36]. The lack of sufficient safety around motor vehicles
44
45 348 is not limited to Africa. The Dominican Republic also recorded high age-standardized TBI
46
47 349 incidence rates; this was also attributed to traffic safety, although the reported reasons were
48
49 350 high rates of people driving while intoxicated and limited policing of traffic violations [37].
50
51
52 351 The high burden of TBI by road injuries in these countries/territories demonstrates that
53
54
55
56
57
58
59
60

1
2
3 352 despite some countries/territories having successfully reduced their road injuries, challenges
4
5 353 remain in others. Furthermore, the variations in causes and rates of TBI in this study suggest
6
7
8 354 that global initiatives to reduce rates of motor vehicle accidents or TBI need to consider the
9
10 355 unique challenges faced by each country and territory rather than a generalist approach to rate
11
12
13 356 reduction [19].
14
15

16 357
17
18 358 Finally, conflict and terrorism was the most common cause of TBI/SCI in 2% (4/204) and 3%
19
20 359 (6/204) of countries/territories, respectively, such as Afghanistan, Yemen, and Syrian Arab
21
22
23 360 Republic, which are likely attributable to the on-going armed conflicts that have occurred in
24
25
26 361 these countries/territories over many years [38-40].
27
28

29 362

31 363 **TBI/SCI Burden by Socio-demographic Index**

32
33
34 364
35
36 365 The burden of TBI was generally higher in countries/territories with higher SDI. One of the
37
38
39 366 reasons for the difference may be disparities in access to healthcare resources [4]. Medical
40
41
42 367 resources are sufficient and easily available in locations with higher SDI, so patients with TBI
43
44
45 368 can be treated and recorded in time. However, medical resources are insufficient in locations
46
47 369 with lower SDI, and patients may die of treatable TBI and even fail to receive a diagnostic
48
49
50 370 code. Furthermore, data from countries/territories with higher SDI may be more reliable than
51
52 371 locations with lower SDI, so estimates in locations with higher SDI may be closer to the true
53
54
55 372 disease burden [5].
56

57 373
58
59
60

374 **Strengths and Limitations**

375

376 This study had some strengths. First, it provided the most up-to-date global, regional, and
377 national burden of TBI/SCI from 1990 to 2019. The findings can help policymakers acquire
378 the most up-to-date epidemiological characteristics of TBI/SCI in 21 GBD regions and 204
379 countries/territories. Secondly, it presented variations of leading causes of TBI/SCI in 204
380 different countries/territories even within a same geographical region. For example, the
381 leading cause of TBI in the Sub-Saharan Africa region varied from falls in Angola to
382 pedestrian road injuries in Namibia to motor vehicle road injuries in South Africa and conflict
383 and terrorism in the Central African Republic. Falls were also the leading cause of SCI in
384 most countries/territories in the North Africa and Middle East (e.g., Saudi Arabia, Egypt,
385 Qatar); however, conflict and terrorism were the leading cause in Afghanistan, Iraq, Libya,
386 Syrian Arab Republic, and Yemen. The presentation of variations in different
387 countries/territories can provide richer information than a regional analysis and help
388 policymakers identify which causes should be targeted to improve the effectiveness of
389 preventive interventions.

390

391 This study also had some limitations. First, the data sources relied on patients having medical
392 records, so reported estimates would underestimate the true incidence. For example, there was
393 a discrepancy between the annual worldwide estimation of new TBI cases in this study (27.16
394 million) and other recent expert sources (more than 50 million) [7]. The underestimation may
395 be attributed to two reasons.

1
2
3 396
4
5 397 The first reason for underestimation is that the register-based data may not cover all cases. For
6
7
8 398 example, the Nordic countries and the United States are considered to have reliable statistics,
9
10 399 but there are still patients treated at facilities that are not covered by registries (e.g., private
11
12
13 400 healthcare) [7, 41]. Further, many patients with mild TBI go untreated and, therefore,
14
15
16 401 unrecorded; population-based studies with a broad definition of TBI show significantly higher
17
18 402 TBI incidence rates than those based on hospital discharge rates [7]. The second reason for
19
20
21 403 underestimation is that clinical diagnosis codes may not accurately match injuries, especially
22
23
24 404 in patients with multi-trauma. For example, some patients may experience both TBI/SCI from
25
26 405 a traumatic event, but TBI would not be matched to the individual because SCI had a higher
27
28
29 406 rank than TBI in the GBD severity hierarchy [5]. This is because after the GBD Traumatic
30
31 407 Brain Injury and Spinal Cord Injury Collaborators tried to apportion co-occurring non-fatal
32
33
34 408 injuries using regression methods, they found that many long-term disabilities were assigned
35
36 409 to seemingly trivial non-fatal injury categories (e.g., open wounds/bruises), thus pulling
37
38
39 410 disability away from more serious non-fatal injury outcomes (e.g., TBI/SCI) [4]. Therefore,
40
41
42 411 this study followed the method that assigns one non-fatal injury case to the most severe of any
43
44 412 co-occurring non-fatal injuries according to the GBD severity hierarchy [4, 5]. This method
45
46
47 413 was also utilized in the paper by the GBD Traumatic Brain Injury and Spinal Cord Injury
48
49
50 414 Collaborators published in the Lancet Neurology [4].

51
52 415
53
54 416 Second, this study might also underestimate the true prevalence. The GBD 2019 Study
55
56
57 417 calculated the prevalence of non-fatal injuries through probabilities of permanent health loss
58
59
60

1
2
3 418 [5]. Permanent health loss relates to the probability of patients (one year after the injury)
4
5 419 returning to a health status with more disability than their pre-injury health status [5].
6
7
8 420 However, the probabilities of permanent health loss assessed in the GBD Study may be
9
10 421 grossly underestimated, especially for TBI, because accurate TBI prevalence data is even
11
12 422 more limited than incidence data, especially in low/middle-income countries; and TBI is not
13
14 423 an isolated event but can have variable long-term consequences, including dementia, stroke,
15
16 424 parkinsonism, and epilepsy [7]. For example, a large study from a Swedish registry found
17
18 425 higher probabilities of premature mortality, psychiatric inpatient admission/outpatient visits,
19
20 426 disability pension, welfare reciprocity, and low educational attainment after even a mild TBI
21
22 427 compared to uninjured siblings [42]. Furthermore, the associations between TBI and long-
23
24 428 term neurological diseases remain poorly understood; many sequelae other than those
25
26 429 mentioned above have not been considered, leading to an underestimation of the true TBI
27
28 430 prevalence [7].
29
30
31
32
33
34
35
36
37
38

39 431
40 432 Third, a weakness of this study is the ability to estimate incidence in countries with lower-
41
42 433 quality data. Estimates in some data-sparse countries/territories were modeled and predicted
43
44 434 by borrowing estimates from data-rich countries/territories [5]. Therefore, the estimates of the
45
46 435 data-sparse countries/territories (e.g., Democratic People's Republic of Korea) might have a
47
48 436 greater deviation than the true incidence. Furthermore, the cause-specific burden (that is, the
49
50 437 leading cause) of TBI/SCI in some data-sparse countries/territories should be interpreted
51
52 438 carefully. For example, it is logically difficult to explain why falls have surpassed traffic
53
54 439 accidents as the leading cause of SCI in many population-rich Asian countries/territories (e.g.,
55
56
57
58
59
60

1
2
3 440 Malaysia) with chaotic traffic.
4

5 441
6
7
8 442 Fourth, the GBD 2019 Study did not link TBI/SCI with risk factors such as behavioral factors
9
10 443 (e.g., alcohol use), so we could not assess any associations between the two [43].
11
12
13 444 Furthermore, while longitudinal cohort or survey analysis is commonly used to calculate
14
15 445 lifetime prevalence [44, 45], the GBD Study is a cross-sectional analysis conducted iteratively
16
17
18 446 on an annual basis [5]. Short-term disability caused by non-fatal injuries is assumed to last
19
20
21 447 less than one year in the GBD Study, which means that the short-term disability after TBI/SCI
22
23
24 448 in a given year may not be calculated for prevalence in future iterations [5]. Therefore, we
25
26 449 could not calculate the lifetime prevalence of TBI/SCI through the GBD data.
27
28

29 450
30
31 451 Finally, the GBD Traumatic Brain Injury and Spinal Cord Injury Collaborators defined
32
33
34 452 TBI/SCI by ICD-9/ICD-10 codes through physician review. However, with reference to the
35
36
37 453 reviewer's comments, there may be a minor error probably not reflected in the results in the
38
39
40 454 Lancet Neurology paper; the ICD-10 code S06.0 (concussion) can be considered a mild TBI,
41
42 455 but S06.1 (traumatic cerebral edema) in the published paper cannot [4].
43
44

45 456

47 457 **Implications for Future Studies**

48
49 458
50
51
52 459 First, population-based epidemiological studies may be improved in the future through
53
54
55 460 standardized definitions (e.g., standardized criteria for diagnosis), methods (e.g., case
56
57
58 461 ascertainment based on multiple, overlapping sources of information, such as hospitals,
59
60

1
2
3 462 outpatient clinics, general practitioners, and death certificates), and data presentation (e.g.,
4
5 463 collection of a complete calendar year of data) [7]. These improvements would be especially
6
7
8 464 helpful in data-sparse locations to facilitate comparisons between countries/territories. Second,
9
10 465 there is a need for better ways to characterize the currently under-recognized risk of long-term
11
12
13 466 disabling sequelae to bring estimates closer to the true prevalence, especially for mild TBI.
14
15
16 467 Last, we hope that the GBD Collaborators will include the burden of TBI/SCI attributable to
17
18 468 risk factors; this would provide more detailed results on the causes of TBI/SCI and allow for
19
20
21 469 more targeted preventative strategies. Furthermore, we hope that the GBD Collaborators
22
23
24 470 include lifetime prevalence in future iterations to estimate the global impact of TBI/SCI
25
26 471 accurately.
27
28
29 472

31 473 **Conclusions**

32
33
34 474
35
36 475 In conclusion, the global age-standardized incidence rates of TBI had a significant decrease
37
38
39 476 since 1990, whereas SCI had no significant change. Falls was the leading cause of TBI/SCI in
40
41
42 477 74% (150/204) and 97% (198/204) of countries/territories, respectively, but the variations of
43
44
45 478 leading causes of TBI/SCI did exist between countries/territories, even within a same
46
47 479 geographic region. Although declining, high burden of TBI remained a concern in both higher
48
49
50 480 and lower SDI countries/territories. High burden of SCI from falls in almost all
51
52 481 countries/territories demonstrates the need for falls reduction to be a global priority now and
53
54
55 482 into the future, but priorities may vary between countries/territories.

Global, Regional, and National Disease Burden

Regionally, Eastern Europe had the largest age-standardized incidence rates (737 [633 to 857] cases per 100,000 population), age-standardized prevalence estimates (1312 [1240 to 1393] cases per 100,000 population), and age-standardized YLD rates (193 [136 to 261] YLDs per 100,000 population) of TBI in 2019. High-income North America had the largest age-standardized incidence rates (23 [17 to 30] cases per 100,000 population), age-standardized prevalence estimates (438 [404 to 474] cases per 100,000 population), and age-standardized YLD rates (113 [80 to 146] YLDs per 100,000 population) of SCI in 2019.

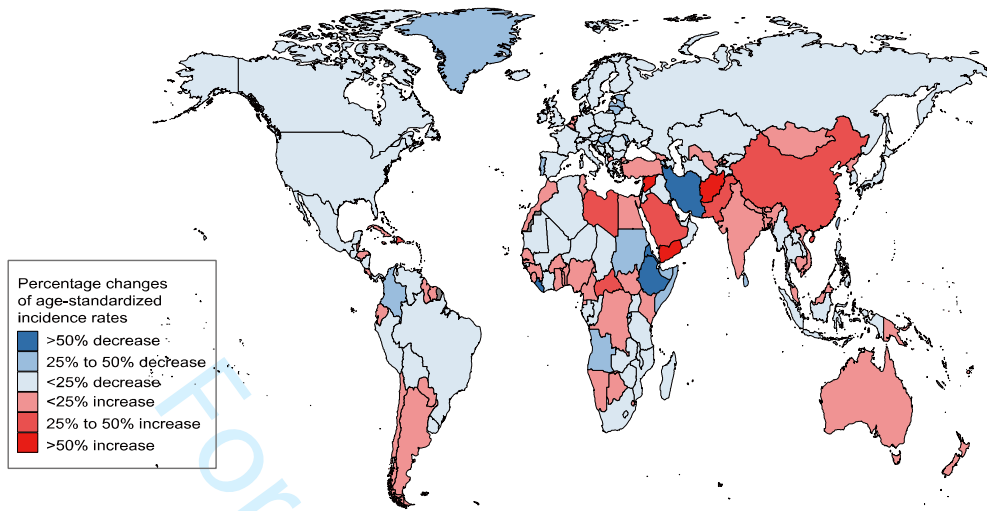

Nationally, for TBI, Slovenia had the largest age-standardized incidence rates (885 [768 to 1036] cases per 100,000 population), age-standardized prevalence estimates (1521 [1448 to 1595] cases per 100,000 population), and age-standardized YLD rates (223 [157 to 303] YLDs per 100,000 population) in 2019. For SCI, Afghanistan had the largest age-standardized incidence rates (44 [12 to 132] cases per 100,000 population), and Syrian Arab Republic had the largest age-standardized prevalence estimates (1049 [333 to 2942] cases per 100,000 population) and age-standardized YLD rates (403 [113 to 1150] YLDs per 100,000 population) in 2019.

Leading Causes by Country and Territory

By falls, the countries/territories with the top three largest increase in age-standardized incidence rates of TBI from 1990 to 2019 were Turkey (100.3% [88.8% to 114.5%]), Bhutan (96.7% [86.9% to 108.0%]), and Cambodia (73.5% [67.6% to 79.9%]), and the top three decreasing rates were in Democratic People's Republic of Korea (-38.1% [-40.2% to -35.8%]), Armenia (-35.1% [-41.2% to -28.4%]), and Latvia (-34.6% [-38.4% to -30.9%]) (out of 150 countries/territories). By pedestrian road injuries, the top three countries/territories by increasing rates were Lesotho (49.5% [38.4% to 59.9%]), Cabo Verde (28.1% [19.2% to 37.2%]), and Ghana (18.3% [11.2% to 26.6%]), and the top three countries/territories by decreasing rates were Zimbabwe (-32.5% [-38.5% to -26.4%]), Rwanda (-30.3% [-34.9% to -25.3%]), and South Sudan (-19.2% [-24.3% to -13.9%]) (out of 29 countries/territories). By motor vehicle road injuries, the countries/territories with the top three largest increase in rates were Dominican Republic (38.5% [24.0% to 54.6%]), Sao Tome and Principe (28.9% [20.0% to 38.6%]), and Seychelles (26.8% [15.3% to 39.3%]), and there were only two countries/territories had a significant decrease in their rates: South Africa (-26.0% [-30.5% to -21.3%]) and Mauritania (-11.2% [-17.4% to -4.2%]) (amongst the 11 included countries/territories).

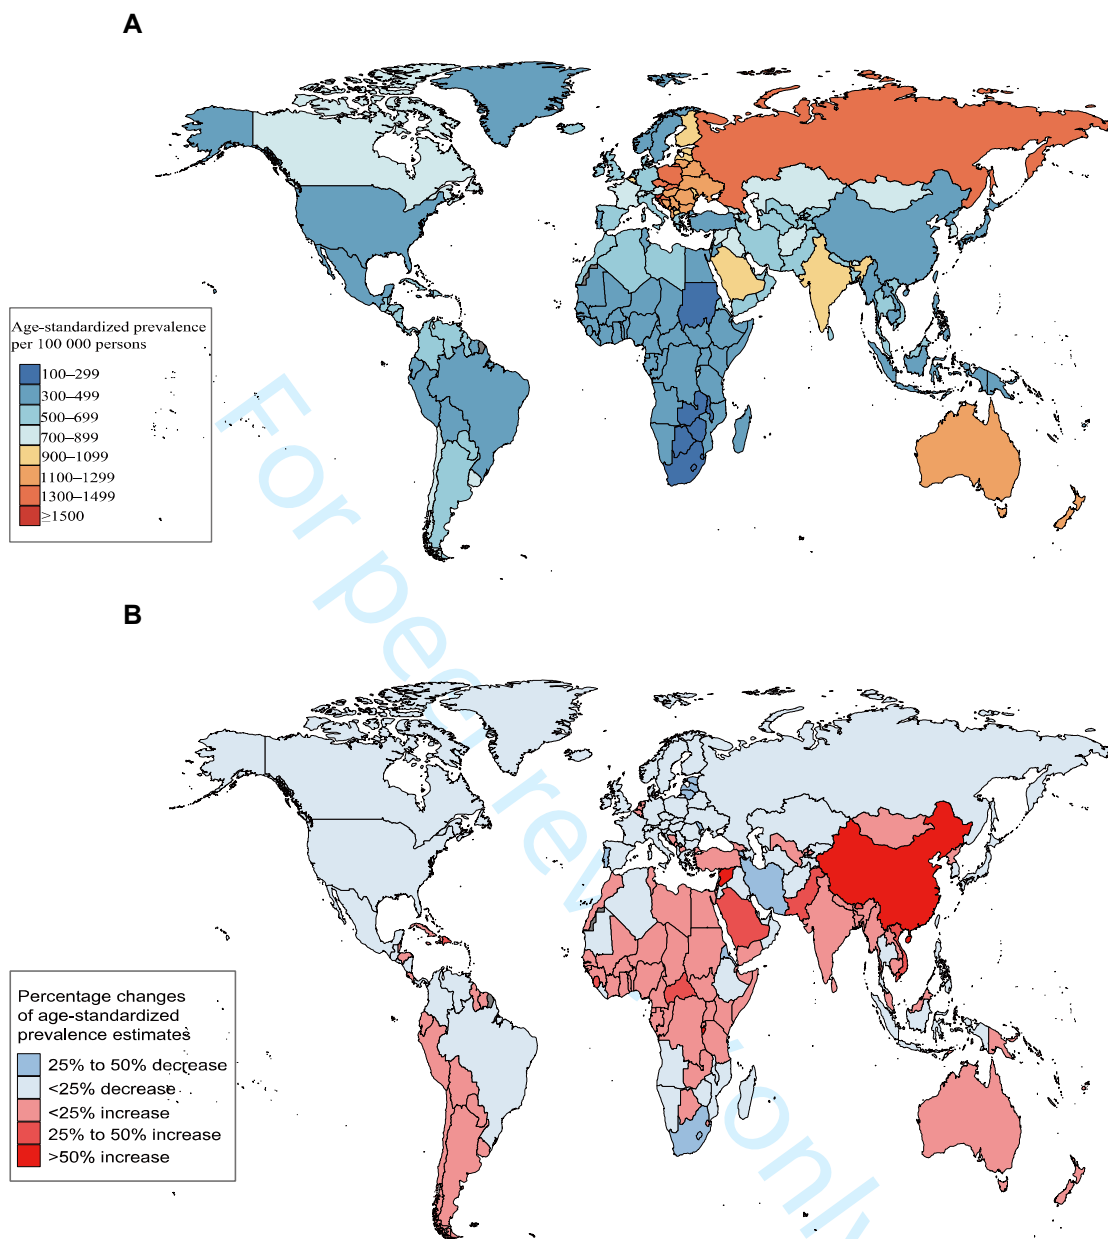

Regarding change rates in falls (as a cause of SCI) from 1990 to 2019, the countries/territories with the largest increase in age-standardized incidence rates were Turkey (110.5% [97.3% to 125.4%]), Bhutan (101.1% [90.9% to 112.6%]), and Cambodia (76.5% [70.1% to 83.1%]), and the top largest declines were in Democratic People's Republic of Korea (-37.2% [-39.3% to -34.9%]), Latvia (-34.5% [-37.9% to -31.0%]), and Armenia (-33.9% [-39.3% to -27.9%]) (out of 198 countries/territories).

Table 2. Global Burden of Disease severity hierarchy for nature-of-injury

Rank	Inpatient hierarchy	Outpatient hierarchy
1	Spinal cord lesion below neck level	Fracture of pelvis
2	Amputation of lower limbs, bilateral	Fracture of patella, tibia or fibula, or ankle
3	Amputation of upper limbs, bilateral	Fracture of hip
4	Spinal cord lesion at neck level	Fracture of skull
5	Fracture of hip	Amputation of thumb
6	Fracture of femur, other than femoral neck	Fracture of vertebral column
7	Amputation of upper limb, unilateral	Multiple fractures, dislocations, crashes, wounds, sprains, and strains
8	Amputation of lower limb, unilateral	Internal hemorrhage in abdomen and pelvis
9	Multiple fractures, dislocations, crashes, wounds, sprains, and strains	Fracture of femur, other than femoral neck
10	Effect of different environmental factors	Dislocation of hip
11	Fracture of patella, tibia or fibula, or ankle	Amputation of toe/toes
12	Moderate-Severe traumatic brain injury	Fracture of hand (wrist and other distal part of hand)
13	Fracture of foot bones except ankle	Amputation of fingers (excluding thumb)
14	Internal hemorrhage in abdomen and pelvis	Burns, <20% of total burned surface area without lower airway burns
15	Crush injury	Dislocation of knee
16	Minor traumatic brain injury	Contusion in any part of the body
17	Fracture of pelvis	Minor traumatic brain injury
18	Nerve injury	Foreign body in respiratory system
19	Severe chest injury	Severe chest injury
20	Dislocation of hip	Drowning and nonfatal submersion
21	Burns, $\geq 20\%$ total burned surface area or $\geq 10\%$ burned surface area if head/neck or hands/wrist involved w/o lower airway burns	Asphyxiation
22	Lower airway burns	Poisoning requiring urgent care
23	Fracture of skull	Effect of different environmental factors
24	Amputation of thumb	Foreign body in GI and urogenital system
25	Fracture of hand (wrist and other distal part of hand)	Fracture of sternum and/or fracture of one or more ribs
26	Fracture of vertebral column	Nerve injury
27	Contusion in any part of the body	Fracture of face bones
28	Open wound(s)	Dislocation of shoulder
29	Amputation of toe/toes	Injury to eyes
30	Dislocation of knee	Fracture of clavicle, scapula, or humerus
31	Amputation of fingers (excluding thumb)	Fracture of radius and/or ulna
32	Drowning and nonfatal submersion	Fracture of foot bones except ankle
33	Asphyxiation	Foreign body in ear

Rank	Inpatient hierarchy	Outpatient hierarchy
34	Burns, <20% total burned surface area without lower airway burns	Muscle and tendon injuries, including sprains and strains lesser dislocations
35	Muscle and tendon injuries, including sprains and strains lesser dislocations	Superficial injury of any part of the body
36	Fracture of face bones	Open wound(s)
37	Foreign body in respiratory system	Complications following therapeutic procedures
38	Poisoning requiring urgent care	
39	Foreign body in GI and urogenital system	
40	Fracture of sternum and/or fracture of one or more ribs	
41	Dislocation of shoulder	
42	Injury to eyes	
43	Fracture of clavicle, scapula, or humerus	
44	Fracture of radius and/or ulna	
45	Foreign body in ear	
46	Superficial injury of any part of the body	
47	Complications following therapeutic procedures	

Table 3. Global Burden of Disease lay descriptions and disability weights for health states

Health state	Lay description	Disability weight
Concussion	has headaches, dizziness, nausea and difficulty concentrating.	0.110 (0.074–0.158)
Severe traumatic brain injury: short term, with or without treatment	cannot concentrate and has headaches, memory problems, dizziness, and feels angry.	0.214 (0.141–0.297)
Traumatic brain injury: long-term consequences, minor, with or without treatment	has episodes of headaches, memory problems, and difficulty concentrating.	0.094 (0.063–0.133)
Traumatic brain injury: long-term consequences, moderate, with or without treatment	has frequent headaches, memory problems, difficulty concentrating, and dizziness. The person is often anxious and moody.	0.231 (0.156–0.324)
Traumatic brain injury: long-term consequences, severe, with or without treatment	cannot think clearly and has frequent headaches, memory problems, difficulty concentrating and dizziness. The person is often anxious and moody, and depends on others for feeding, toileting, dressing and walking.	0.637 (0.462–0.789)
Spinal cord lesion below neck: treated	is paralyzed from the waist down, cannot feel or move the legs and has difficulties with urine and bowel control. The person uses a wheelchair to move around.	0.296 (0.198–0.414)
Spinal cord lesion below neck: untreated	is paralyzed from the waist down, cannot feel or move the legs and has difficulties with urine and bowel control. Legs are in fixed, bent positions, and the person gets frequent infections and pressure sores.	0.623 (0.434–0.777)
Spinal cord lesion at neck: treated	is paralyzed from the neck down, with no feeling or control over any part of the body below the neck, and no urine or bowel control.	0.589 (0.415–0.748)
Spinal cord lesion at neck: untreated	is paralyzed from the neck down, with no feeling or control over any part of the body below the neck, and no urine or bowel control. Arms and legs are in fixed, bent positions, and the person gets frequent infections and pressure sores.	0.732 (0.544–0.871)

eTable 6. Global Burden of Disease (GBD) cause hierarchy with levels for injuries

Cause	Level
Injuries	1
Transport injuries	2
Road injuries	3
Pedestrian road injuries	4
Cyclist road injuries	4
Motorcyclist road injuries	4
Motor vehicle road injuries	4
Other road injuries	4
Other transport injuries	3
Unintentional injuries	2
Falls	3
Drowning	3
Fire, heat, and hot substances	3
Poisonings	3
Poisoning by carbon monoxide	4
Poisoning by other means	4
Exposure to mechanical forces	3
Unintentional firearm injuries	4
Other exposure to mechanical forces	4
Adverse effects of medical treatment	3
Animal contact	3
Venomous animal contact	4
Non-venomous animal contact	4
Foreign body	3
Pulmonary aspiration and foreign body in airway	4
Foreign body in eyes	4
Foreign body in other body part	4
Environmental heat and cold exposure	3
Exposure to forces of nature	3
Other unintentional injuries	3
Self-harm and interpersonal violence	2
Self-harm	3
Self-harm by firearm	4
Self-harm by other specified means	4
Interpersonal violence	3
Physical violence by firearm	4
Physical violence by sharp object	4
Physical violence by other means	4
Conflict and terrorism	3
Executions and police conflict	3

The 29 causes in **bold** (they were called the most detailed causes in the GBD 2019 study) were analyzed in our study, which was consistent with the statistical analysis in the previous GBD 2016 study published in The Lancet Neurology.

eTable 15. Incidence for 1990 and 2019 and percentage changes of age-standardized rates by location and cause for spinal cord injury, 1990–2019

Location	Cause	Age-standardized rates per 100,000 (95% UI) (1990)	Age-standardized rates per 100,000 (95% UI) (2019)	Percentage change of age-standardized rates (95% UI) (1990–2019)
Afghanistan	Adverse effects of medical treatment	0 (0 to 0)	0 (0 to 0)	0% (0% to 0%)
Afghanistan	Conflict and terrorism	7 (2 to 21)	40 (8 to 128)	NA
Afghanistan	Cyclist road injuries	0 (0 to 0)	0 (0 to 0)	-6.2% (-14.7% to 2.5%)
Afghanistan	Drowning	0 (0 to 0)	0 (0 to 0)	-20.4% (-25.9% to -13.6%)
Afghanistan	Environmental heat and cold exposure	0 (0 to 0)	0 (0 to 0)	-0.9% (-5.2% to 4.8%)
Afghanistan	Executions and police conflict	0 (0 to 0)	0 (0 to 0)	NA
Afghanistan	Exposure to forces of nature	0 (0 to 0)	0 (0 to 0)	NA
Afghanistan	Falls	1 (1 to 1)	1 (1 to 2)	24.6% (20.1% to 29.1%)
Afghanistan	Fire, heat, and hot substances	0 (0 to 0)	0 (0 to 0)	-10.1% (-16.6% to -2%)
Afghanistan	Foreign body in eyes	0 (0 to 0)	0 (0 to 0)	0% (0% to 0%)
Afghanistan	Foreign body in other body part	0 (0 to 0)	0 (0 to 0)	-2.2% (-5.7% to 1.4%)
Afghanistan	Motor vehicle road injuries	0 (0 to 1)	0 (0 to 1)	-19% (-25.6% to -12%)
Afghanistan	Motorcyclist road injuries	0 (0 to 0)	0 (0 to 0)	-8.9% (-18.5% to 0.9%)
Afghanistan	Non-venomous animal contact	0 (0 to 0)	0 (0 to 0)	-5.5% (-11.1% to -0.2%)
Afghanistan	Other exposure to mechanical forces	0 (0 to 1)	0 (0 to 1)	-3.8% (-9.3% to 2.1%)
Afghanistan	Other road injuries	0 (0 to 0)	0 (0 to 0)	-3.9% (-14.2% to 6.9%)
Afghanistan	Other transport injuries	0 (0 to 0)	0 (0 to 0)	4.7% (0.6% to 9.5%)

Checklist of information that should be included in new reports of global health estimates

Item #	Checklist item	Reported on page #
Objectives and funding		
1	Define the indicator(s), populations (including age, sex, and geographic entities), and time period(s) for which estimates were made.	Main Pg. 5-10
2	List the funding sources for the work.	Main Pg. 22
Data Inputs		
<i>For all data inputs from multiple sources that are synthesized as part of the study:</i>		
3	Describe how the data were identified and how the data were accessed.	Main Pg. 5-10
4	Specify the inclusion and exclusion criteria. Identify all ad-hoc exclusions.	Main Pg. 6-7 https://ghdx.healthdata.org/gbd-2019/data-input-sources
5	Provide information on all included data sources and their main characteristics. For each data source used, report reference information or contact name/institution, population represented, data collection method, year(s) of data collection, sex and age range, diagnostic criteria or measurement method, and sample size, as relevant.	Main Pg. 6-7 https://ghdx.healthdata.org/gbd-2019/data-input-sources
6	Identify and describe any categories of input data that have potentially important biases (e.g., based on characteristics listed in item 5).	https://ghdx.healthdata.org/gbd-2019/data-input-sources https://ghdx.healthdata.org/gbd-2019/code
<i>For data inputs that contribute to the analysis but were not synthesized as part of the study:</i>		
7	Describe and give sources for any other data inputs.	N/A
<i>For all data inputs:</i>		
8	Provide all data inputs in a file format from which data can be efficiently extracted (e.g., a spreadsheet rather than a PDF), including all relevant meta-data listed in item 5. For any data inputs that cannot be shared because of ethical or legal reasons, such as third-party ownership, provide a contact name or the name of the institution that retains the right to the data.	https://ghdx.healthdata.org/gbd-2019/data-input-sources
Data analysis		
9	Provide a conceptual overview of the data analysis method. A diagram may be helpful.	Main Pg. 9-10

10	Provide a detailed description of all steps of the analysis, including mathematical formulae. This description should cover, as relevant, data cleaning, data pre-processing, data adjustments and weighting of data sources, and mathematical or statistical model(s).	Main Pg. 9-10 https://ghdx.healthdata.org/gbd-2019/code
11	Describe how candidate models were evaluated and how the final model(s) were selected.	N/A
12	Provide the results of an evaluation of model performance, if done, as well as the results of any relevant sensitivity analysis.	N/A
13	Describe methods for calculating uncertainty of the estimates. State which sources of uncertainty were, and were not, accounted for in the uncertainty analysis.	Main Pg. 8-9
14	State how analytic or statistical source code used to generate estimates can be accessed.	https://ghdx.healthdata.org/gbd-2019/code
Results and Discussion		
15	Provide published estimates in a file format from which data can be efficiently extracted.	https://vizhub.healthdata.org/gbd-results/
16	Report a quantitative measure of the uncertainty of the estimates (e.g. uncertainty intervals).	Main Pg. 10-13
17	Interpret results in light of existing evidence. If updating a previous set of estimates, describe the reasons for changes in estimates.	Main Pg. 13-17
18	Discuss limitations of the estimates. Include a discussion of any modelling assumptions or data limitations that affect interpretation of the estimates.	Main Pg. 17-20

This checklist should be used in conjunction with the GATHER statement and Explanation and Elaboration document, found on gather-statement.org

STROBE Statement—Checklist of items that should be included in reports of *cross-sectional studies*

	Item No	Recommendation	Page No
Title and abstract	1	(a) Indicate the study's design with a commonly used term in the title or the abstract	Main Pg. 2
		(b) Provide in the abstract an informative and balanced summary of what was done and what was found	Main Pg. 2
Introduction			
Background/rationale	2	Explain the scientific background and rationale for the investigation being reported	Main Pg. 4-5
Objectives	3	State specific objectives, including any prespecified hypotheses	Main Pg. 5
Methods			
Study design	4	Present key elements of study design early in the paper	Main Pg. 5-6
Setting	5	Describe the setting, locations, and relevant dates, including periods of recruitment, exposure, follow-up, and data collection	Main Pg. 6-7 https://ghdx.healthdata.org/gbd-2019/data-input-sources
Participants	6	(a) Give the eligibility criteria, and the sources and methods of selection of participants	Main Pg. 6-7 https://ghdx.healthdata.org/gbd-2019/data-input-sources
Variables	7	Clearly define all outcomes, exposures, predictors, potential confounders, and effect modifiers. Give diagnostic criteria, if applicable	Main Pg. 7-9 https://vizhub.healthdata.org/gbd-results/
Data sources/ measurement	8*	For each variable of interest, give sources of data and details of methods of assessment (measurement). Describe comparability of assessment methods if there is more than one group	Main Pg. 6-7 https://vizhub.healthdata.org/gbd-results/
Bias	9	Describe any efforts to address potential sources of bias	https://ghdx.healthdata.org/gbd-2019/data-input-sources

			https://ghdx.healthdata.org/gbd-2019/code
Study size	10	Explain how the study size was arrived at	N/A
Quantitative variables	11	Explain how quantitative variables were handled in the analyses. If applicable, describe which groupings were chosen and why	Main Pg. 7-9 https://ghdx.healthdata.org/gbd-2019/code
Statistical methods	12	(a) Describe all statistical methods, including those used to control for confounding	Main Pg. 9-10 https://ghdx.healthdata.org/gbd-2019/code
		(b) Describe any methods used to examine subgroups and interactions	N/A
		(c) Explain how missing data were addressed	N/A
		(d) If applicable, describe analytical methods taking account of sampling strategy	N/A
		(e) Describe any sensitivity analyses	N/A
Results			
Participants	13*	(a) Report numbers of individuals at each stage of study—eg numbers potentially eligible, examined for eligibility, confirmed eligible, included in the study, completing follow-up, and analysed	https://ghdx.healthdata.org/gbd-2019/data-input-sources https://ghdx.healthdata.org/gbd-2019/code
		(b) Give reasons for non-participation at each stage	https://ghdx.healthdata.org/gbd-2019/data-input-sources https://ghdx.healthdata.org/gbd-2019/code
		(c) Consider use of a flow diagram	https://ghdx.healthdata.org/gbd-2019/data-input-sources https://ghdx.healthdata.org/gbd-2019/code
Descriptive data	14*	(a) Give characteristics of study participants (eg demographic, clinical, social) and information on exposures and potential confounders	Main Pg. 10-13

		(b) Indicate number of participants with missing data for each variable of interest	N/A
Outcome data	15*	Report numbers of outcome events or summary measures	Main Pg. 10-13
Main results	16	(a) Give unadjusted estimates and, if applicable, confounder-adjusted estimates and their precision (eg, 95% confidence interval). Make clear which confounders were adjusted for and why they were included	Main Pg. 10-13
		(b) Report category boundaries when continuous variables were categorized	N/A
		(c) If relevant, consider translating estimates of relative risk into absolute risk for a meaningful time period	N/A
Other analyses	17	Report other analyses done—eg analyses of subgroups and interactions, and sensitivity analyses	N/A
Discussion			
Key results	18	Summarise key results with reference to study objectives	Main Pg. 13-17
Limitations	19	Discuss limitations of the study, taking into account sources of potential bias or imprecision. Discuss both direction and magnitude of any potential bias	Main Pg. 17-20
Interpretation	20	Give a cautious overall interpretation of results considering objectives, limitations, multiplicity of analyses, results from similar studies, and other relevant evidence	Main Pg. 20-22
Generalisability	21	Discuss the generalisability (external validity) of the study results	Main Pg. 20-22
Other information			
Funding	22	Give the source of funding and	Main Pg. 22

the role of the funders for the present study and, if applicable, for the original study on which the present article is based	
--------------------------------------------------------------------------------------------------------------------------------	--

*Give information separately for exposed and unexposed groups.

Note: An Explanation and Elaboration article discusses each checklist item and gives methodological background and published examples of transparent reporting. The STROBE checklist is best used in conjunction with this article (freely available on the Web sites of PLoS Medicine at <http://www.plosmedicine.org/>, Annals of Internal Medicine at <http://www.annals.org/>, and Epidemiology at <http://www.epidem.com/>). Information on the STROBE Initiative is available at www.strobe-statement.org.

BMJ Open

Global, regional, and national burden of traumatic brain injury and spinal cord injury, 1990–2019: a systematic analysis for the Global Burden of Disease Study 2019

Journal:	<i>BMJ Open</i>
Manuscript ID	bmjopen-2023-075049.R2
Article Type:	Original research
Date Submitted by the Author:	19-Sep-2023
Complete List of Authors:	Guan, Bin; Shandong University Cheeloo College of Medicine Anderson, David; The University of Sydney Faculty of Medicine and Health Chen, Lingxiao; Shandong University Cheeloo College of Medicine; The University of Sydney Faculty of Medicine and Health Feng, Shiqing; Shandong University Cheeloo College of Medicine; The Second Hospital of Shandong University Zhou, Hengxing; Shandong University Cheeloo College of Medicine
Primary Subject Heading:	Neurology
Secondary Subject Heading:	Epidemiology, Global health, Neurology, Public health
Keywords:	EPIDEMIOLOGY, NEUROLOGY, ORTHOPAEDIC & TRAUMA SURGERY, PUBLIC HEALTH

8 26 Global, regional, and national burden of traumatic brain injury and spinal cord injury, 1990–
9
10 27 2019: a systematic analysis for the Global Burden of Disease Study 2019
11
12
13 28
14

15
16 29 **Abstract**
17
18 30
19
20

21 31 **Objectives:** To evaluate the most up-to-date burden of traumatic brain injury (TBI) and spinal
22
23 32 cord injury (SCI) and analyze their leading causes in different countries/territories.
24
25
26 33

27
28
29 34 **Design:** An analysis of Global Burden of Disease (GBD) data.
30
31 35

32
33
34 36 **Setting:** The epidemiologic data were gathered from GBD Results Tool (January 1,
35
36 37 1990–December 31, 2019) covering 21 GBD regions and 204 countries/ territories.
38
39 38

40
41
42 39 **Participants:** Patients with TBI/SCI.
43
44 40

45
46
47 41 **Main outcomes and measures:** Absolute numbers and age-standardized rates/estimates of
48
49 42 incidence, prevalence, and years lived with disability (YLDs) of TBI/SCI by location in 2019,
50
51 43 with their percentage changes from 1990 to 2019. The leading causes (e.g., falls) of TBI/SCI
52
53 44 in 204 countries/territories.
54
55
56
57 45
58
59
60

1
2
3 46 **Results:** Globally, in 2019, TBI had 27.16 million new cases, 48.99 million prevalent cases,
4
5 47 and 7.08 million YLDs. SCI had 0.91 million new cases, 20.64 million prevalent cases, and
6
7 48 6.20 million YLDs. Global age-standardized incidence rates of TBI decreased significantly by
8
9 49 -5.5% (95% uncertainty interval, -8.9% to -3.0%) from 1990 to 2019, whereas SCI had no
10
11 50 significant change (-6.1% [-17.3% to 1.5%]). Regionally, in 2019, Eastern Europe and High-
12
13 51 income North America had the highest burden of TBI and SCI, respectively. Nationally, in
14
15 52 2019, Slovenia and Afghanistan had the highest age-standardized incidence rates of TBI and
16
17 53 SCI, respectively. For TBI, falls was the leading cause in 74% (150/204) of
18
19 54 countries/territories, followed by pedestrian road injuries (14%, 29/204), motor vehicle road
20
21 55 injuries (5%, 11/204), and conflict and terrorism (2%, 4/204). For SCI, falls was the leading
22
23 56 cause in 97% (198/204) of countries/territories, followed by conflict and terrorism (3%,
24
25 57 6/204).

26
27 58
28
29 59 **Conclusions:** Global age-standardized incidence rates of TBI have decreased significantly
30
31 60 since 1990, whereas SCI had no significant change. The leading causes of TBI/SCI globally
32
33 61 were falls, but variations did exist between countries/territories. Policymakers should continue
34
35 62 to prioritize interventions to reduce falls, but priorities may vary between countries/territories.
36
37 63

38 39 64 **Strengths and Limitations of This Study**

- 40
41 65
- 42 66 ● One of the strengths of this study was that it provided the most up-to-date global,
43
44 67 regional, and national burden of TBI/SCI from 1990 to 2019.
- 45
46
47
48
49
50
51
52
53
54
55
56
57
58
59
60

68

69 ● Another strength of this study was that it presented the variations of leading causes of
70 TBI/SCI in 204 countries/territories, which have not been assessed before.

71

72 ● One of the limitations was that this study might underestimate the true incidence and
73 period prevalence of TBI/SCI; was unable to calculate lifetime prevalence of TBI/SCI
74 through the GBD data.

75

76 ● The second limitation was that the estimates of TBI/SCI for some data-sparse
77 countries/territories in this study should be interpreted carefully.

78

79 ● The third limitation was that this study could not assess associations between risk factors
80 and TBI/SCI burden through the GBD data.

81

82

83 **Introduction**

84

85 Traumatic brain injury (TBI) and spinal cord injury (SCI) continue to pose challenges to the
86 global public health systems, and the resulting disabilities have brought huge economic
87 burden to patients, public health systems, and societies [1, 2]. Compared with the previous
88 Global Burden of Disease (GBD) 2016 Study [3, 4], new available data sources and improved

5

1
2
3 89 statistical methods in the GBD 2019 Study led to the GBD 2019 results superseding those
4
5 90 from previous rounds of GBD [5]. Besides, nine additional countries/territories were firstly
6
7
8 91 incorporated in the calculation of disease burden in the GBD 2019 Study [5]. An update on
9
10 92 the 2016 results of the burden of TBI/SCI is therefore warranted.

11
12
13 93
14
15 94 Ding *et al.* reported the burden of SCI at the global and regional levels through the GBD 2019
16
17 95 data, but did not mention the disease burden in individual countries/territories [6]. However, it
18
19 96 will not allow for identifying variations that can exist between countries/territories within a
20
21 97 same world or a same geographical region. Take the previous GBD 2016 Study as an
22
23 98 example, the leading cause of TBI in the region, North Africa and Middle East, was
24
25 99 concluded to be falls [4]. It was true in Saudi Arabia, whereas it did not reflect the reality in
26
27 100 other countries/territories within North Africa and Middle East, such as, Afghanistan, where
28
29 101 conflict and terrorism was the leading cause of TBI [4]. Failure to present the data in
30
31 102 individual countries/territories can prevent policymakers from identifying which causes
32
33 103 should be targeted; wasting resources and reducing effectiveness of any interventions [7].
34
35
36
37
38
39
40
41
42
43

44 105 Therefore, in this study, we aimed to provide the most up-to-date burden of TBI/SCI through
45
46 106 the GBD 2019 data. Also, we analyzed the leading causes of TBI/SCI in 204
47
48 107 countries/territories. Finally, the associations between the burden of TBI/SCI and Socio-
49
50 108 demographic Index (SDI) in 204 countries/territories was explored.
51
52
53

Overview

This study of global health estimates followed the Guidelines for Accurate and Transparent Health Estimates Reporting (GATHER) Statement and the Strengthening the Reporting of Observational Studies in Epidemiology (STROBE) Statement [8, 9]. The GBD 2019 Study estimated burden of 369 diseases and injuries and 87 risk factors through multiple epidemiological measures, including incidence, prevalence, mortality, years of life lost (YLLs), years lived with disability (YLDs), and disability-adjusted life years (DALYs) by age, sex, cause, year, and location from 1990 to 2019 [5]. Our methods used for estimation of the burden of TBI and SCI were based on the framework of the GBD 2019 Study, which had already been described comprehensively elsewhere [5, 10]. Although TBI/SCI could cause death, they were not defined as a cause-of-death in the GBD 2019 Study [5]. Therefore, in this study, we provided the burden of TBI/SCI by incidence, prevalence, and YLDs, but not mortality or YLLs.

Case Definitions

Based on the framework of the GBD 2019 Study [5], the definitions of TBI/SCI in this study relied on the International Classification of Diseases, Ninth Revision (ICD-9) and the International Classification of Diseases, Tenth Revision (ICD-10), which had also been described in details in the previous GBD 2016 Study published in The Lancet Neurology [4].

1
2
3 133 Additionally, a clarification from the GBD 2019 Study is that TBI/SCI are both defined as a
4
5 134 nature-of-injury but not a cause-of-injury [5]. For example, TBI/SCI could be caused by a
6
7
8 135 fall, the fall was therefore defined as a cause-of-injury and TBI/SCI as a nature-of-injury.
9

10 136

13 137 **Data Source**

14 138

15
16
17
18 139 The data for 21 GBD regions and 204 countries/territories between January 1, 1990, and
19
20
21 140 December 31, 2019, were available from the GBD Results Tool
22
23 141 (<https://vizhub.healthdata.org/gbd-results/>). The data utilized in this study were from patients
24
25
26 142 requiring medical care in hospital and emergency department records [5]. Furthermore,
27
28
29 143 compared with the GBD 2016 Study, new available data sources were incorporated into
30
31
32 144 estimates of non-fatal injuries in the GBD 2019 iteration, such as injury claims data from the
33
34 145 Accident Compensation Corporation in New Zealand, national survey data from China,
35
36 146 Ghana, India, Mexico, Russian Federation, and South Africa from the World Health
37
38
39 147 Organization's Study on Global AGEing and Adult Health, and literature studies data from
40
41
42 148 India and South Africa based on inputs from the GBD collaborator network [5]. Each data
43
44
45 149 source was assigned a unique identifier and included in the Global Health Data Exchange
46
47 150 (<https://ghdx.healthdata.org/gbd-2019/data-input-sources>). Additionally, considering that
48
49
50 151 there are variations in quality of data by each country and territory, estimates in some data-
51
52
53 152 sparse countries/territories were modelled and predicted by borrowing estimates from data-
54
55 153 rich countries/territories [5]. Detailed data sources used to estimate the burden of non-fatal
56
57
58 154 injuries from each country and territory were listed in **eTable 1**. More details of the data
59
60

155 sources and model strategies have been published elsewhere [5, 10].

156

157 **Calculation of Incidence, Prevalence, and Years Lived with Disability**

158

159 The features of data processing used to calculate incidence, prevalence, and YLDs in this
160 study were consistent with the framework of the GBD 2019 Study [5]. First, the data inputs of
161 different cause-of-injury were incorporated and modelled by a Bayesian meta-regression tool,
162 DisMod-MR 2.1, to infer the incidence of each cause-of-injury. Second, the GBD severity
163 hierarchy for nature-of-injury (**eTable 2**) was utilized to establish a point-to-point relationship
164 between cause-of-injury and nature-of-injury, which means that when multiple nature-of-
165 injuries were caused by one cause-of-injury, nature-of-injury with the highest rank in the
166 GBD severity hierarchy was selected to match it. Based on the framework of the GBD 2019
167 Study [5], because SCI had a higher rank in the GBD severity hierarchy than TBI, SCI was
168 chosen if both conditions happened to an individual in our study, which was also consistent
169 with the calculation process of the previous GBD 2016 Study published in The Lancet
170 Neurology [4]. Third, for the short-term disability (the duration was less than one year), the
171 prevalence was approximately calculated as the incidence multiplied by the average duration.
172 For the long-term disability (the duration was more than one year), DisMod-MR 2.1 was
173 utilized to convert incidence to prevalence. Fourth, the GBD disability weights (**eTable 3**)
174 were utilized to calculate YLDs. The GBD disability weights were evaluated on a 0–1 scale,
175 with 0 representing complete health and 1 representing death [11]. For the short-term
176 disability, YLDs were calculated as the prevalence multiplied by the GBD disability weights.

1
2
3 177 For the long-term disability, YLDs were calculated with the similar process but adjusted by
4
5 178 comorbidity correction. Finally, the incidence, prevalence, and YLDs were aggregated to
6
7
8 179 calculate the all-cause incidence, prevalence, and YLDs of TBI/SCI. Due to some sampling
9
10
11 180 errors and non-sampling variances, we calculated the 95% uncertainty interval (UI) using the
12
13 181 same methods described previously in the GBD 2019 Study [5]. Generally, UI were from
14
15
16 182 1,000 draw-level estimates for each parameter, and 95% UI were defined by the 25th and 975th
17
18 183 values of the ordered 1,000 estimates.
19
20

21 184

23 185 **Statistical Analysis**

26 186

28
29 187 Firstly, according to the GBD location hierarchy (**eTable 4**) in the GBD 2019 Study [5], we
30
31 188 calculated absolute numbers and age-standardized rates/estimates of incidence, prevalence,
32
33
34 189 and YLD of TBI/SCI in 21 GBD regions and 204 countries/territories in 2019. The age-
35
36
37 190 standardized rate/estimate is calculated by $\frac{\sum_{i=1}^A a_i w_i}{\sum_{i=1}^A w_i}$, where a_i is the age-specific rate/estimate
38
39
40 191 of the age group i , and w_i is the weight of the age group i derived from the GBD 2019 world
41
42
43 192 population standard (**eTable 5**) [12]. Secondly, based on the framework of the GBD 2019
44
45
46 193 Study [5], we used percentage changes of age-standardized rates/estimates of incidence,
47
48 194 prevalence, and YLD to calculate trends in the burden of TBI/SCI from 1990 to 2019. If the
49
50
51 195 95% UI of a percentage change did not include zero, it was determined to be a significant
52
53
54 196 change, and vice versa [13]. Thirdly, according to the GBD cause hierarchy (**eTable 6**) in the
55
56 197 GBD 2019 Study [5], we analyzed the leading causes (e.g., falls, pedestrian road injuries,
57
58 198 motor vehicle road injuries, conflict and terrorism, etc.) for age-standardized incidence rates
59
60

1
2
3 199 of TBI/SCI in 204 countries/territories in 2019, and we also analyzed trends in age-
4
5 200 standardized incidence rates of TBI/SCI caused by the leading causes in the corresponding
6
7
8 201 countries/territories from 1990 to 2019 (except three causes: conflict and terrorism, exposure
9
10 202 to forces of nature, and executions and police conflict, which were considered as fatal
11
12
13 203 discontinuities and defined as random events due to not having predictable time trends in the
14
15 204 GBD 2019 Study [5]). More details about definitions of causes and corresponding ICD-
16
17
18 205 9/ICD-10 codes had already been described elsewhere [5]. Fourthly, based on one prior GBD
19
20
21 206 paper by GBD Fracture Collaborators [14], we reported the top three countries/territories
22
23
24 207 with age-standardized incidence rates caused by each cause, and the top three
25
26 208 countries/territories with both the largest increase and the largest decrease to explore potential
27
28
29 209 reasons for their cause-specific disease burden. Finally, considering that the data was non-
30
31 210 normal distributed (Shapiro-Wilk test had a p-value equal to <0.001), the associations
32
33
34 211 between SDI (a composite indicator of income per capita, years of schooling, and fertility
35
36 212 rate; SDI ranges from 0 to 1 in the GBD 2019 Study, where 0 represents the lowest income
37
38
39 213 per capita, the fewest years of schooling, and the highest fertility rate, and vice versa [5],
40
41
42 214 **eTable 7**) and the age-standardized YLD rates in 204 countries/territories in 2019 were
43
44
45 215 analyzed by Spearman correlation tests to examine the effect of SDI on the disease burden
46
47 216 [15-17]. All statistical analyses and figures drawing were conducted in R program (version
48
49
50 217 4.1.3) and GraphPad Prism (version 7.0.0). Statistical significance was defined as two-tailed
51
52 218 $P<0.05$.

53

56 57 220 **Patient and Public Involvement Statement**

58
59
60

221

222 None.

223

224 **Results**

225

226 **Global, Regional, and National Disease Burden**

227

228 Globally, TBI had 27.16 (95% UI, 23.36 to 31.42) million new cases, 48.99 (46.84 to 51.32)
229 million prevalent cases, and 7.08 (5.00 to 9.59) million YLDs in 2019 (**Table 1; eTables 8-**
230 **10**). There were 346 (95% UI, 298 to 401) cases per 100,000 population, 599 (573 to 627)
231 cases per 100,000 population, and 87 (61 to 117) YLDs per 100,000 population for age-
232 standardized incidence rates, age-standardized prevalence estimates, and age-standardized
233 YLD rates of TBI in 2019, respectively (**Figure 1; eFigures 1-3**). SCI had 0.91 (0.71 to 1.16)
234 million new cases, 20.64 (18.93 to 23.61) million prevalent cases, and 6.20 (4.47 to 8.16)
235 million YLDs in 2019 (**Table 2; eTables 11-13**). There were 12 (9 to 15) cases per 100,000
236 population, 253 (231 to 290) cases per 100,000 population, and 76 (55 to 100) YLDs per
237 100,000 population for age-standardized incidence rates, age-standardized prevalence
238 estimates, and age-standardized YLD rates of SCI in 2019, respectively (**eFigures 4-6**).
239 Global age-standardized incidence rates of TBI decreased significantly by -5.5% (95% UI, -
240 8.9% to -3.0%) from 1990 to 2019. By contrast, there was no significant change in global age-
241 standardized incidence rates of SCI (-6.1% [-17.3% to 1.5%]) from 1990 to 2019. Regional
242 and national TBI/SCI burden were described in the **eResults**.

243

244 **Leading Causes by Country and Territory**

245

246 Considering the cause-specific age-standardized incidence rates of TBI in 2019, falls was the
247 leading cause in 74% (150/204) of countries/territories, followed by pedestrian road injuries
248 (14%, 29/204), motor vehicle road injuries (5%, 11/204), and conflict and terrorism (2%,
249 4/204) (**Figure 2; eTable 14**). The top three countries/territories with age-standardized
250 incidence rates by falls were Finland (418 [324 to 539] cases per 100,000 population),
251 Slovenia (401 [320 to 504] cases per 100,000 population), and Croatia (400 [318 to 501]
252 cases per 100,000 population) (out of 150 countries/territories), by pedestrian road injuries
253 were Mozambique (103 [76 to 134] cases per 100,000 population), Ghana (83 [61 to 109]
254 cases per 100,000 population), and Guinea-Bissau (71 [50 to 95] cases per 100,000
255 population) (out of 29 countries/territories), by motor vehicle road injuries were Comoros (86
256 [61 to 117] cases per 100,000 population), Mauritania (79 [56 to 109] cases per 100,000
257 population), and Cameroon (75 [52 to 103] cases per 100,000 population) (out of 11
258 countries/territories), and by conflict and terrorism were Afghanistan (356 [134 to 798] cases
259 per 100,000 population), Yemen (256 [103 to 590] cases per 100,000 population), and Syrian
260 Arab Republic (180 [68 to 394] cases per 100,000 population) (out of 4 countries/territories)
261 (**Figure 3**).

262

263 For SCI, falls was the leading cause for age-standardized incidence rates in 97% (198/204) of
264 countries/territories in 2019, followed by conflict and terrorism (3%, 6/204) (**eTable 15**). The

1
2
3 265 top three countries/territories with age-standardized incidence rates by falls were Greenland
4
5 266 (23 [15 to 34] cases per 100,000 population), Norway (21 [14 to 33] cases per 100,000
6
7
8 267 population), and Sweden (19 [12 to 29] cases per 100,000 population) (out of 198
9
10 268 countries/territories), and by conflict and terrorism were Afghanistan (40 [8 to 128] cases per
11
12
13 269 100,000 population), Yemen (22 [5 to 66] cases per 100,000 population), and Syrian Arab
14
15
16 270 Republic (21 [4 to 64] cases per 100,000 population) (out of 6 countries/territories).
17
18 271 Percentage changes of cause-specific TBI/SCI burden were described in the **eResults**.
19
20
21 272
22

23 273 **Disease Burden by Socio-demographic Index**

24
25
26 274
27
28
29 275 Generally, a positive association was found between age-standardized YLD rates of TBI and
30
31 276 SDI in 204 countries/territories in 2019 ($\rho=0.42$, $P<.001$) (**eFigure 7**). SCI on the other hand,
32
33
34 277 had no statistical association with SDI ($\rho=-0.05$, $P=0.49$), although the SCI burden in a few
35
36 278 countries/territories, such as Afghanistan, far exceeded those of others.
37
38
39 279
40
41

42 280 **Discussion**

43
44 281
45
46
47 282 This study provided the most up-to-date burden of TBI and SCI using GBD 2019 data. It also
48
49 283 presented the variations between the leading causes of TBI/SCI in 204 countries/territories.
50
51

52 284 Finally, it explored the associations between each national SDI and the burden of TBI/SCI.
53
54
55 285

57 286 **Incidence of TBI/SCI**

1
2
3 287
4
5 288 Globally, the age-standardized incidence rates of TBI significantly decreased since 1990. This
6
7
8 289 improvement may reflect the benefits of global initiatives to reduce TBI rates. For example,
9
10 290 major efforts have focused on road safety and reduced road-related injuries, a leading cause of
11
12
13 291 TBI globally [18]. In 2004, the United Nations General Assembly and the World Health
14
15
16 292 Organization passed resolutions calling for preventive measures against road injuries [19].
17
18 293 The resolutions were championed in many countries/territories successively [19]. The age-
19
20
21 294 standardized TBI incidence rates decreased significantly from 1990 to 2019 by -7.2% (-11.9%
22
23
24 295 to -2.0%) in Oman, -20.3% (-22.5% to -17.9%) in Russia, and -9.8% (-13.6% to -5.4%) in
25
26 296 Sweden, demonstrating the effectiveness of their interventions.
27
28

29 297
30
31 298 Unfortunately, the global age-standardized SCI incidence rates did not significantly change
32
33
34 299 despite the decreases in TBI. Although we used the same GBD 2019 data, this conclusion
35
36 300 differs from Ding *et al.*'s finding that the global age-standardized incidence rates of SCI
37
38
39 301 decreased since 1990 [6]. Ding *et al.* calculated the temporal trends of the global age-
40
41
42 302 standardized incidence rates of SCI using the Estimated Annual Percentage Change (EAPC)
43
44 303 [6]. The EAPC was based on a linear regression mode of the age-standardized rates and the
45
46
47 304 calendar year [20]. However, EAPC can be biased in modeling injuries from natural disasters
48
49
50 305 or wars; if included, it inflates estimates in volatile regions [21]. Furthermore, Ding *et al.*
51
52 306 misinterpreted their statistical results [6]. The EAPC was -0.08 but had a 95% confidence
53
54
55 307 interval of -0.24 to 0.09 [6]. By focusing only on the point estimate of -0.08 and neglecting
56
57
58 308 the confidence interval, they failed to convey that the confidence interval crossed zero. That
59
60

1
2
3 309 approach may confuse and bring biased information to policymakers [22]. Our study showed
4
5 310 a non-significant change in the global age-standardized incidence rates of SCI (-6.1% [-17.3%
6
7
8 311 to 1.5%]). The lack of SCI change may be because motor vehicle accidents are a major cause
9
10 312 of TBI but not SCI. As discussed below, other interventions may be required to reduce SCI
11
12
13 313 [23, 24].
14
15
16 314

17 18 315 **Causes of TBI/SCI** 19

20
21 316
22
23 317 One challenge in any global effort to reduce falls is the aging population. The global
24
25 318 population over the age of 65 rose from 6.2% in 1990 to 9.1% in 2019 [25]. Falls are more
26
27 319 common in older than younger adults owing to sarcopenia, osteoporosis, sleeping disturbance,
28
29 320 multimorbidity, and frailty [13]. Several countries/territories with high age-standardized
30
31 321 incidence rates of TBI/SCI by falls also have percentages of older adults that far exceeds the
32
33 322 world average of 9.1% of the population. Examples include Finland (22.1% of the population
34
35 323 over the age of 65 in 2019), Slovenia (20.2%), Croatia (20.9%), Norway (17.3%), and
36
37 324 Sweden (20.2%) [25]. Although some components of falls are modifiable, some
38
39 325 countries/territories have unique challenges due to their geographical features. Finland,
40
41 326 Norway, and Sweden have cold climates and unique environmental risk factors (i.e., icy
42
43 327 sidewalks) that may increase their populations' fall risk [26, 27]. Environmental risks may
44
45 328 need to be prioritized in these countries/territories, particularly as their populations age.
46
47
48
49
50
51
52
53
54
55 329

1
2
3 330 This study also examined changes in age-standardized incidence rates by falls. Turkey had the
4
5 331 largest increases from 1990 to 2019 (TBI: 100.3% [88.8% to 114.5%], SCI: 110.5% [97.3%
6
7
8 332 to 125.4%]). Armenia had a significant decrease in both TBI (-35.1% [-41.2% to -28.4%])
9
10 333 and SCI (-33.9% [-39.3% to -27.9%]). The reasons for this change were unknown but may be
11
12 334 related to changes in resource allocation. The gross domestic product (GDP, current USD) in
13
14 335 Armenia increased from \$2.26 billion in 1990 to \$13.86 billion in 2019, leading to increased
15
16 336 healthcare spending that may have improved public healthcare education [28-30]. By contrast,
17
18 337 Turkey faced economic difficulty in recent years; its GDP decreased from \$957.78 billion in
19
20 338 2013 to \$761 billion in 2019, which may have contributed to the significant increases in this
21
22 339 study [30].
23
24
25
26
27
28
29
30

31 341 Road injuries were the leading cause of TBI in 20% (40/204) of the countries/territories.
32
33 342 There was a higher prevalence in African countries/territories. One possible reason for the
34
35 343 high prevalence in Africa may be the rapid increase in motor vehicle ownership [31], without
36
37 344 sufficient road infrastructure (i.e., roads and traffic safety) [32-35]. A previous study found
38
39 345 non-adherence to traffic regulations, poorly maintained roads, inadequate traffic signage, and
40
41 346 a lack of pedestrian protections as possible reasons behind Mozambique's high age-
42
43 347 standardized incidence rates of TBI [36]. The lack of sufficient safety around motor vehicles
44
45 348 is not limited to Africa. The Dominican Republic also recorded high age-standardized TBI
46
47 349 incidence rates; this was also attributed to traffic safety, although the reported reasons were
48
49 350 high rates of people driving while intoxicated and limited policing of traffic violations [37].
50
51
52 351 The high burden of TBI by road injuries in these countries/territories demonstrates that
53
54
55
56
57
58
59
60

1
2
3 352 despite some countries/territories having successfully reduced their road injuries, challenges
4
5 353 remain in others. Furthermore, the variations in causes and rates of TBI in this study suggest
6
7
8 354 that global initiatives to reduce rates of motor vehicle accidents or TBI need to consider the
9
10 355 unique challenges faced by each country and territory rather than a generalist approach to rate
11
12
13 356 reduction [19].
14
15

16 357
17
18 358 Finally, conflict and terrorism was the most common cause of TBI/SCI in 2% (4/204) and 3%
19
20 359 (6/204) of countries/territories, respectively, such as Afghanistan, Yemen, and Syrian Arab
21
22
23 360 Republic, which are likely attributable to the on-going armed conflicts that have occurred in
24
25
26 361 these countries/territories over many years [38-40].
27
28

29 362
30
31 363 **TBI/SCI Burden by Socio-demographic Index**
32
33
34 364
35
36 365 The burden of TBI was generally higher in countries/territories with higher SDI. One of the
37
38
39 366 reasons for the difference may be disparities in access to healthcare resources [4]. Medical
40
41
42 367 resources are sufficient and easily available in locations with higher SDI, so patients with TBI
43
44
45 368 can be treated and recorded in time. However, medical resources are insufficient in locations
46
47 369 with lower SDI, and patients may die of treatable TBI and even fail to receive a diagnostic
48
49
50 370 code. Furthermore, data from countries/territories with higher SDI may be more reliable than
51
52
53 371 locations with lower SDI, so estimates in locations with higher SDI may be closer to the true
54
55 372 disease burden [5].
56

57 373
58
59
60

374 **Strengths and Limitations**

375

376 This study had some strengths. First, it provided the most up-to-date global, regional, and
377 national burden of TBI/SCI from 1990 to 2019. The findings can help policymakers acquire
378 the most up-to-date epidemiological characteristics of TBI/SCI in 21 GBD regions and 204
379 countries/territories. Secondly, it presented variations of leading causes of TBI/SCI in 204
380 different countries/territories even within a same geographical region. For example, the
381 leading cause of TBI in the Sub-Saharan Africa region varied from falls in Angola to
382 pedestrian road injuries in Namibia to motor vehicle road injuries in South Africa and conflict
383 and terrorism in the Central African Republic. Falls were also the leading cause of SCI in
384 most countries/territories in the North Africa and Middle East (e.g., Saudi Arabia, Egypt,
385 Qatar); however, conflict and terrorism were the leading cause in Afghanistan, Iraq, Libya,
386 Syrian Arab Republic, and Yemen. The presentation of variations in different
387 countries/territories can provide richer information than a regional analysis and help
388 policymakers identify which causes should be targeted to improve the effectiveness of
389 preventive interventions.

390

391 This study also had some limitations. First, the data sources relied on patients having medical
392 records, so reported estimates would underestimate the true incidence. For example, there was
393 a discrepancy between the annual worldwide estimation of new TBI cases in this study (27.16
394 million) and other recent expert sources (more than 50 million) [7]. The underestimation may
395 be attributed to two reasons.

1
2
3 396
4
5 397 The first reason for underestimation is that the register-based data may not cover all cases. For
6
7
8 398 example, the Nordic countries and the United States are considered to have reliable statistics,
9
10 399 but there are still patients treated at facilities that are not covered by registries (e.g., private
11
12 400 healthcare) [7, 41]. Further, many patients with mild TBI go untreated and, therefore,
13
14 401 unrecorded; population-based studies with a broad definition of TBI show significantly higher
15
16 402 TBI incidence rates than those based on hospital discharge rates [7]. The second reason for
17
18 403 underestimation is that clinical diagnosis codes may not accurately match injuries, especially
19
20 404 in patients with multi-trauma. For example, some patients may experience both TBI/SCI from
21
22 405 a traumatic event, but TBI would not be matched to the individual because SCI had a higher
23
24 406 rank than TBI in the GBD severity hierarchy [5]. This is because after the GBD Traumatic
25
26 407 Brain Injury and Spinal Cord Injury Collaborators tried to apportion co-occurring non-fatal
27
28 408 injuries using regression methods, they found that many long-term disabilities were assigned
29
30 409 to seemingly trivial non-fatal injury categories (e.g., open wounds/bruises), thus pulling
31
32 410 disability away from more serious non-fatal injury outcomes (e.g., TBI/SCI) [4]. Therefore,
33
34 411 this study followed the method that assigns one non-fatal injury case to the most severe of any
35
36 412 co-occurring non-fatal injuries according to the GBD severity hierarchy [4, 5]. This method
37
38 413 was also utilized in the paper by the GBD Traumatic Brain Injury and Spinal Cord Injury
39
40 414 Collaborators published in the Lancet Neurology [4].
41
42
43
44
45
46
47
48
49
50

51
52 415
53
54 416 Second, this study might also underestimate the true period prevalence. The GBD 2019 Study
55
56 417 calculated the period prevalence of non-fatal injuries through probabilities of permanent
57
58
59
60

1
2
3 418 health loss [5]. Permanent health loss relates to the probability of patients (one year after the
4
5 419 injury) returning to a health status with more disability than their pre-injury health status [5].
6
7
8 420 However, the probabilities of permanent health loss assessed in the GBD Study may be
9
10 421 grossly underestimated, especially for TBI, because accurate TBI prevalence data is even
11
12 422 more limited than incidence data, especially in low/middle-income countries; and TBI is not
13
14 423 an isolated event but can have variable long-term consequences, including dementia, stroke,
15
16 424 parkinsonism, and epilepsy [7]. For example, a large study from a Swedish registry found
17
18 425 higher probabilities of premature mortality, psychiatric inpatient admission/outpatient visits,
19
20 426 disability pension, welfare reciprocity, and low educational attainment after even a mild TBI
21
22 427 compared to uninjured siblings [42]. Furthermore, the associations between TBI and long-
23
24 428 term neurological diseases remain poorly understood; many sequelae other than those
25
26 429 mentioned above have not been considered, leading to an underestimation of the true TBI
27
28 430 period prevalence [7]. Referring to the reviewer' comments, we also attempted but could not
29
30 431 calculate the lifetime prevalence of TBI/SCI through the GBD data because, while
31
32 432 longitudinal cohort or survey analysis is commonly used to calculate lifetime prevalence [43,
33
34 433 44], the GBD Study is a cross-sectional analysis conducted iteratively on an annual basis [5].
35
36 434 Short-term disability caused by non-fatal injuries is assumed to last less than one year in the
37
38 435 GBD Study, which means that the short-term disability after TBI/SCI in a given year may not
39
40 436 be calculated for prevalence in future iterations [5].
41
42 437

43
44 438 Third, a weakness of this study is the ability to estimate incidence in countries with lower-
45
46 439 quality data. Estimates in some data-sparse countries/territories were modeled and predicted
47
48
49
50
51
52
53
54
55
56
57
58
59
60

1
2
3 440 by borrowing estimates from data-rich countries/territories [5]. Therefore, the estimates of the
4
5 441 data-sparse countries/territories (e.g., Democratic People's Republic of Korea) might have a
6
7
8 442 greater deviation than the true incidence. Furthermore, the cause-specific burden (that is, the
9
10 443 leading cause) of TBI/SCI in some data-sparse countries/territories should be interpreted
11
12
13 444 carefully. For example, it is logically difficult to explain why falls have surpassed traffic
14
15
16 445 accidents as the leading cause of SCI in many population-rich Asian countries/territories (e.g.,
17
18 446 Malaysia) with chaotic traffic.

19
20
21 447
22
23 448 Fourth, the GBD 2019 Study did not link TBI/SCI with risk factors such as behavioral factors
24
25
26 449 (e.g., alcohol use), so we could not assess any associations between the two (e.g., disease
27
28
29 450 burden attributable to certain risk factors) [45].

30
31 451
32
33
34 452 Finally, the GBD Traumatic Brain Injury and Spinal Cord Injury Collaborators defined
35
36 453 TBI/SCI by ICD-9/ICD-10 codes through physician review. However, with reference to the
37
38
39 454 reviewer's comments, there may be a minor error probably not reflected in the results in the
40
41
42 455 Lancet Neurology paper; the ICD-10 code S06.0 (concussion) can be considered a mild TBI,
43
44 456 but S06.1 (traumatic cerebral edema) in the published paper cannot [4].

45
46
47 457
48
49
50 458 **Implications for Future Studies**

51
52 459
53
54
55 460 First, population-based epidemiological studies may be improved in the future through
56
57 461 standardized definitions (e.g., standardized criteria for diagnosis), methods (e.g., case
58
59
60

1
2
3 462 ascertainment based on multiple, overlapping sources of information, such as hospitals,
4
5 463 outpatient clinics, general practitioners, and death certificates), and data presentation (e.g.,
6
7
8 464 collection of a complete calendar year of data) [7]. These improvements would be especially
9
10 465 helpful in data-sparse locations to facilitate comparisons between countries/territories. Second,
11
12
13 466 there is a need for better ways to characterize the currently under-recognized risk of long-term
14
15
16 467 disabling sequelae to bring estimates closer to the true period prevalence, especially for mild
17
18 468 TBI. Furthermore, we hope that the GBD Collaborators include lifetime prevalence in future
19
20
21 469 iterations to estimate the global impact of TBI/SCI accurately. Last, we hope that the GBD
22
23
24 470 Collaborators will include the burden of TBI/SCI attributable to risk factors; this would
25
26 471 provide more detailed results on the causes of TBI/SCI and allow for more targeted
27
28
29 472 preventative strategies.

30
31 473

34 474 **Conclusions**

35
36 475

37
38
39 476 In conclusion, the global age-standardized incidence rates of TBI had a significant decrease
40
41
42 477 since 1990, whereas SCI had no significant change. Falls was the leading cause of TBI/SCI in
43
44 478 74% (150/204) and 97% (198/204) of countries/territories, respectively, but the variations of
45
46
47 479 leading causes of TBI/SCI did exist between countries/territories, even within a same
48
49
50 480 geographic region. Although declining, high burden of TBI remained a concern in both higher
51
52 481 and lower SDI countries/territories. High burden of SCI from falls in almost all
53
54
55 482 countries/territories demonstrates the need for falls reduction to be a global priority now and
56
57 483 into the future, but priorities may vary between countries/territories.

eResults

Global, Regional, and National Disease Burden

Regionally, Eastern Europe had the largest age-standardized incidence rates (737 [633 to 857] cases per 100,000 population), age-standardized prevalence estimates (1312 [1240 to 1393] cases per 100,000 population), and age-standardized YLD rates (193 [136 to 261] YLDs per 100,000 population) of TBI in 2019. High-income North America had the largest age-standardized incidence rates (23 [17 to 30] cases per 100,000 population), age-standardized prevalence estimates (438 [404 to 474] cases per 100,000 population), and age-standardized YLD rates (113 [80 to 146] YLDs per 100,000 population) of SCI in 2019.

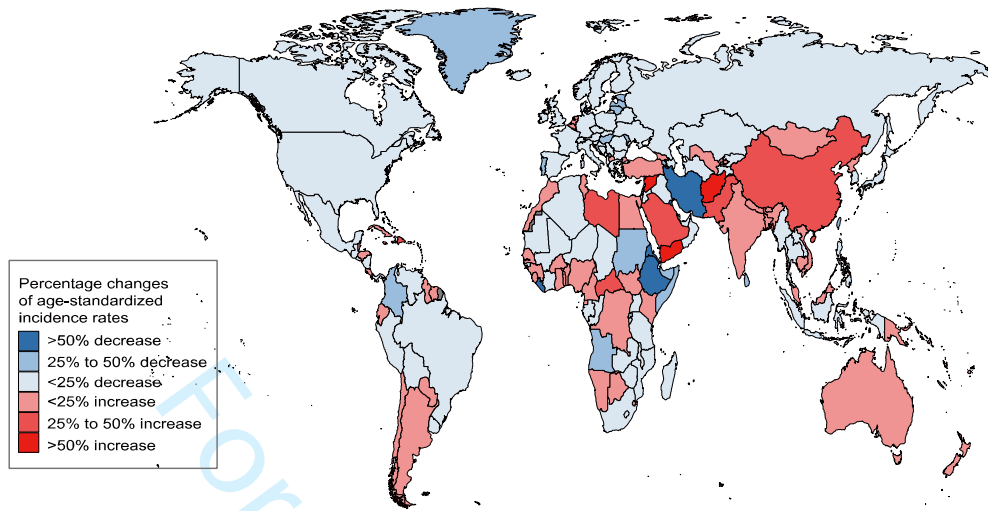

Nationally, for TBI, Slovenia had the largest age-standardized incidence rates (885 [768 to 1036] cases per 100,000 population), age-standardized prevalence estimates (1521 [1448 to 1595] cases per 100,000 population), and age-standardized YLD rates (223 [157 to 303] YLDs per 100,000 population) in 2019. For SCI, Afghanistan had the largest age-standardized incidence rates (44 [12 to 132] cases per 100,000 population), and Syrian Arab Republic had the largest age-standardized prevalence estimates (1049 [333 to 2942] cases per 100,000 population) and age-standardized YLD rates (403 [113 to 1150] YLDs per 100,000 population) in 2019.

Leading Causes by Country and Territory

By falls, the countries/territories with the top three largest increase in age-standardized incidence rates of TBI from 1990 to 2019 were Turkey (100.3% [88.8% to 114.5%]), Bhutan (96.7% [86.9% to 108.0%]), and Cambodia (73.5% [67.6% to 79.9%]), and the top three decreasing rates were in Democratic People's Republic of Korea (-38.1% [-40.2% to -35.8%]), Armenia (-35.1% [-41.2% to -28.4%]), and Latvia (-34.6% [-38.4% to -30.9%]) (out of 150 countries/territories). By pedestrian road injuries, the top three countries/territories by increasing rates were Lesotho (49.5% [38.4% to 59.9%]), Cabo Verde (28.1% [19.2% to 37.2%]), and Ghana (18.3% [11.2% to 26.6%]), and the top three countries/territories by decreasing rates were Zimbabwe (-32.5% [-38.5% to -26.4%]), Rwanda (-30.3% [-34.9% to -25.3%]), and South Sudan (-19.2% [-24.3% to -13.9%]) (out of 29 countries/territories). By motor vehicle road injuries, the countries/territories with the top three largest increase in rates were Dominican Republic (38.5% [24.0% to 54.6%]), Sao Tome and Principe (28.9% [20.0% to 38.6%]), and Seychelles (26.8% [15.3% to 39.3%]), and there were only two countries/territories had a significant decrease in their rates: South Africa (-26.0% [-30.5% to -21.3%]) and Mauritania (-11.2% [-17.4% to -4.2%]) (amongst the 11 included countries/territories).

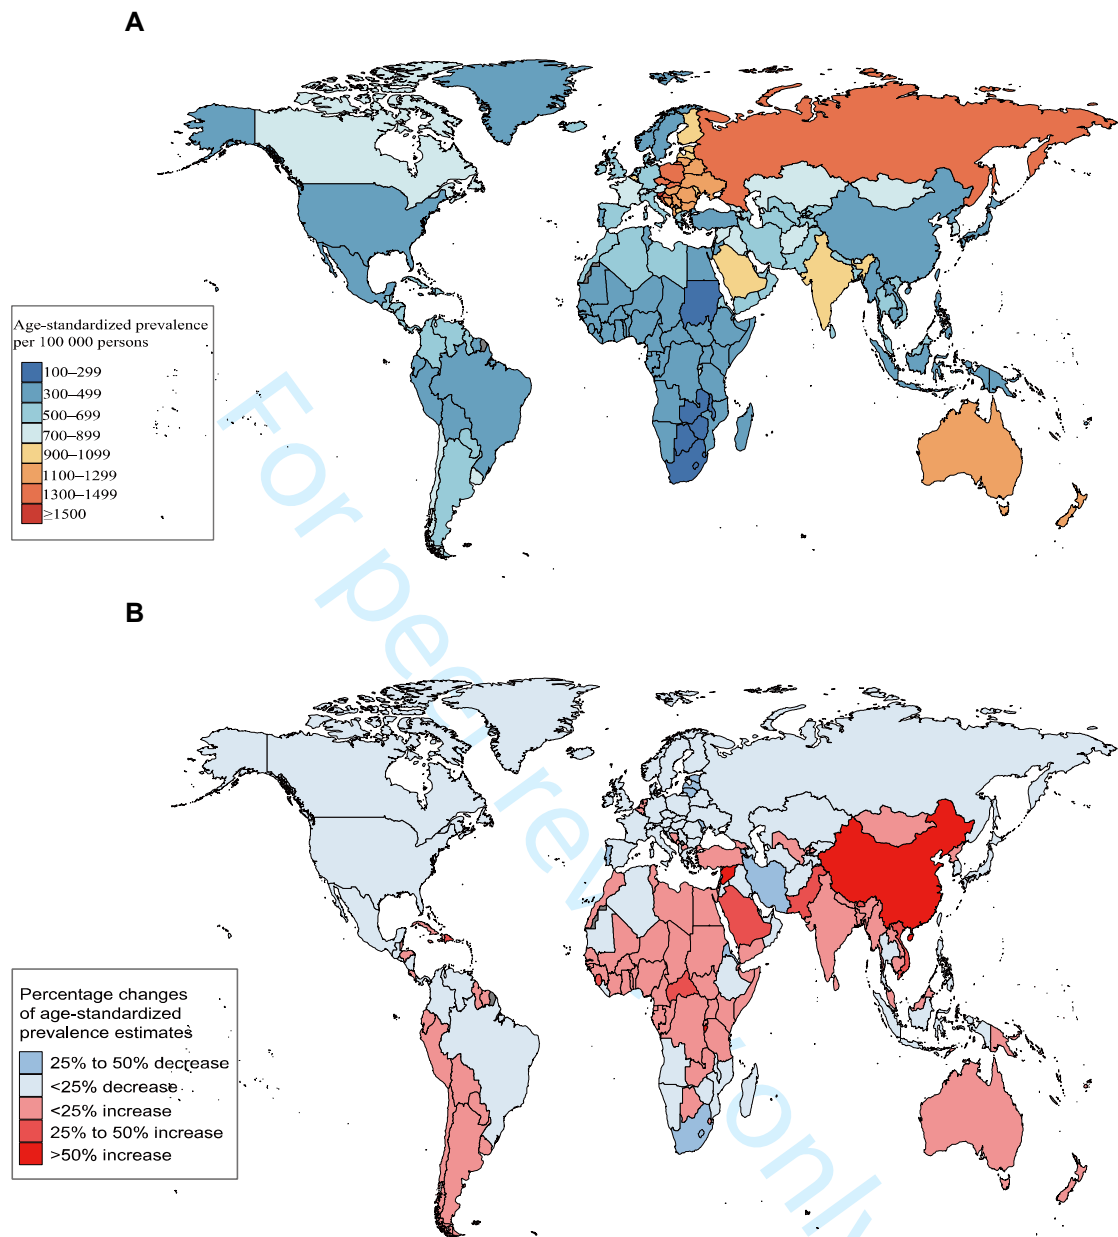

Regarding change rates in falls (as a cause of SCI) from 1990 to 2019, the countries/territories with the largest increase in age-standardized incidence rates were Turkey (110.5% [97.3% to 125.4%]), Bhutan (101.1% [90.9% to 112.6%]), and Cambodia (76.5% [70.1% to 83.1%]), and the top largest declines were in Democratic People's Republic of Korea (-37.2% [-39.3% to -34.9%]), Latvia (-34.5% [-37.9% to -31.0%]), and Armenia (-33.9% [-39.3% to -27.9%]) (out of 198 countries/territories).

Percentage changes of age-standardized incidence rates of traumatic brain injury, 1990–2019

eFigure 2. Prevalence of traumatic brain injury worldwide

Age-standardized prevalence estimates per 100,000 persons of traumatic brain injury (TBI) by location, 2019 (A);

Percentage changes of age-standardized prevalence estimates of TBI, 1990–2019 (B)

eFigure 3. Years lived with disability of traumatic brain injury worldwide

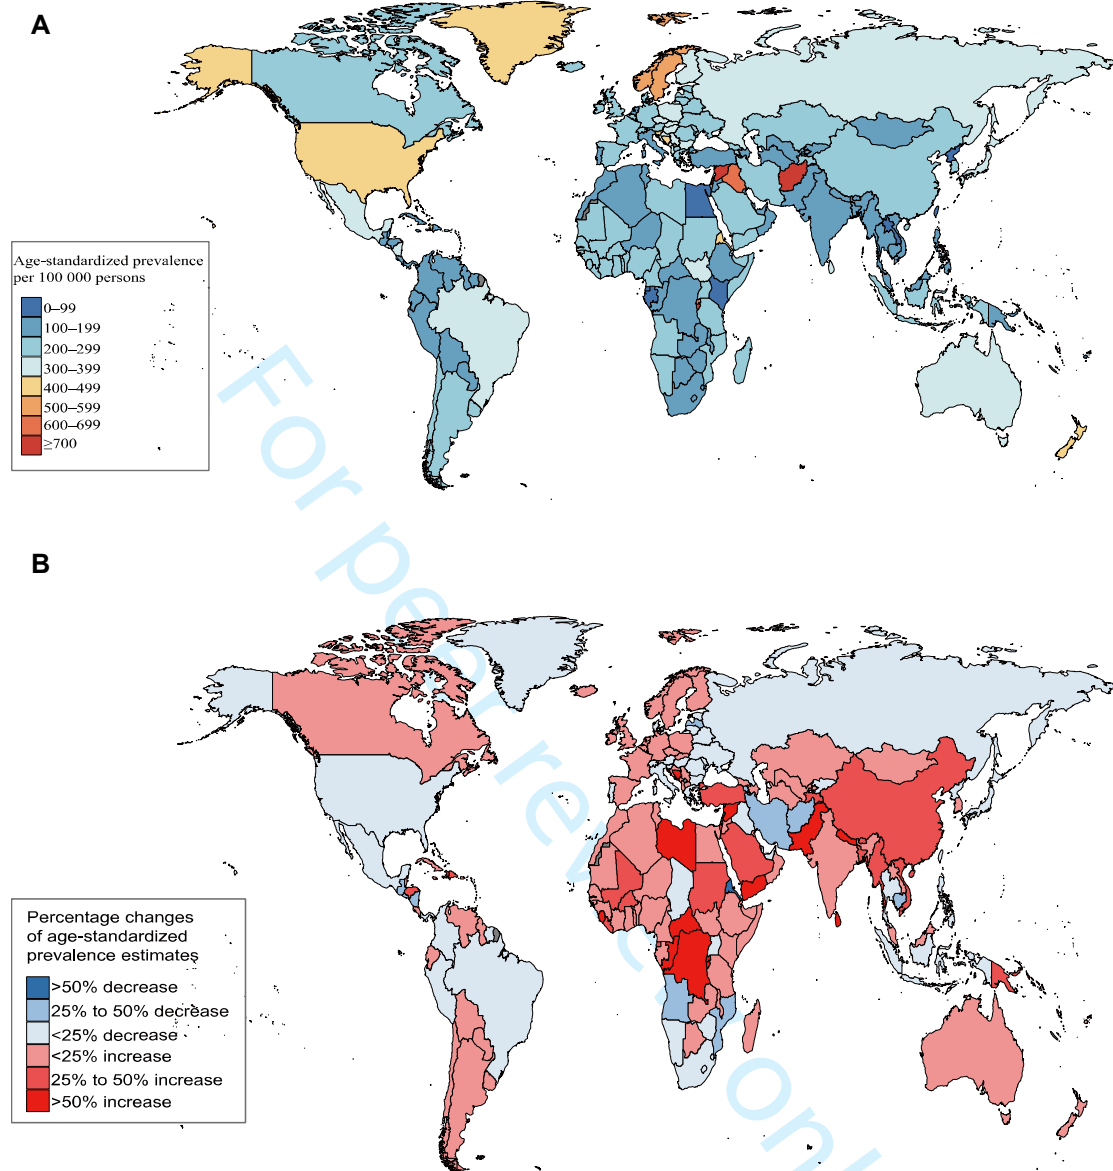

Age-standardized years lived with disability (YLDs) rates per 100,000 persons of traumatic brain injury (TBI) by location, 2019 (A); Percentage changes of age-standardized YLD rates of TBI, 1990–2019 (B)

eFigure 4. Incidence of spinal cord injury worldwide

Percentage changes of age-standardized incidence rates of spinal cord injury, 1990–2019

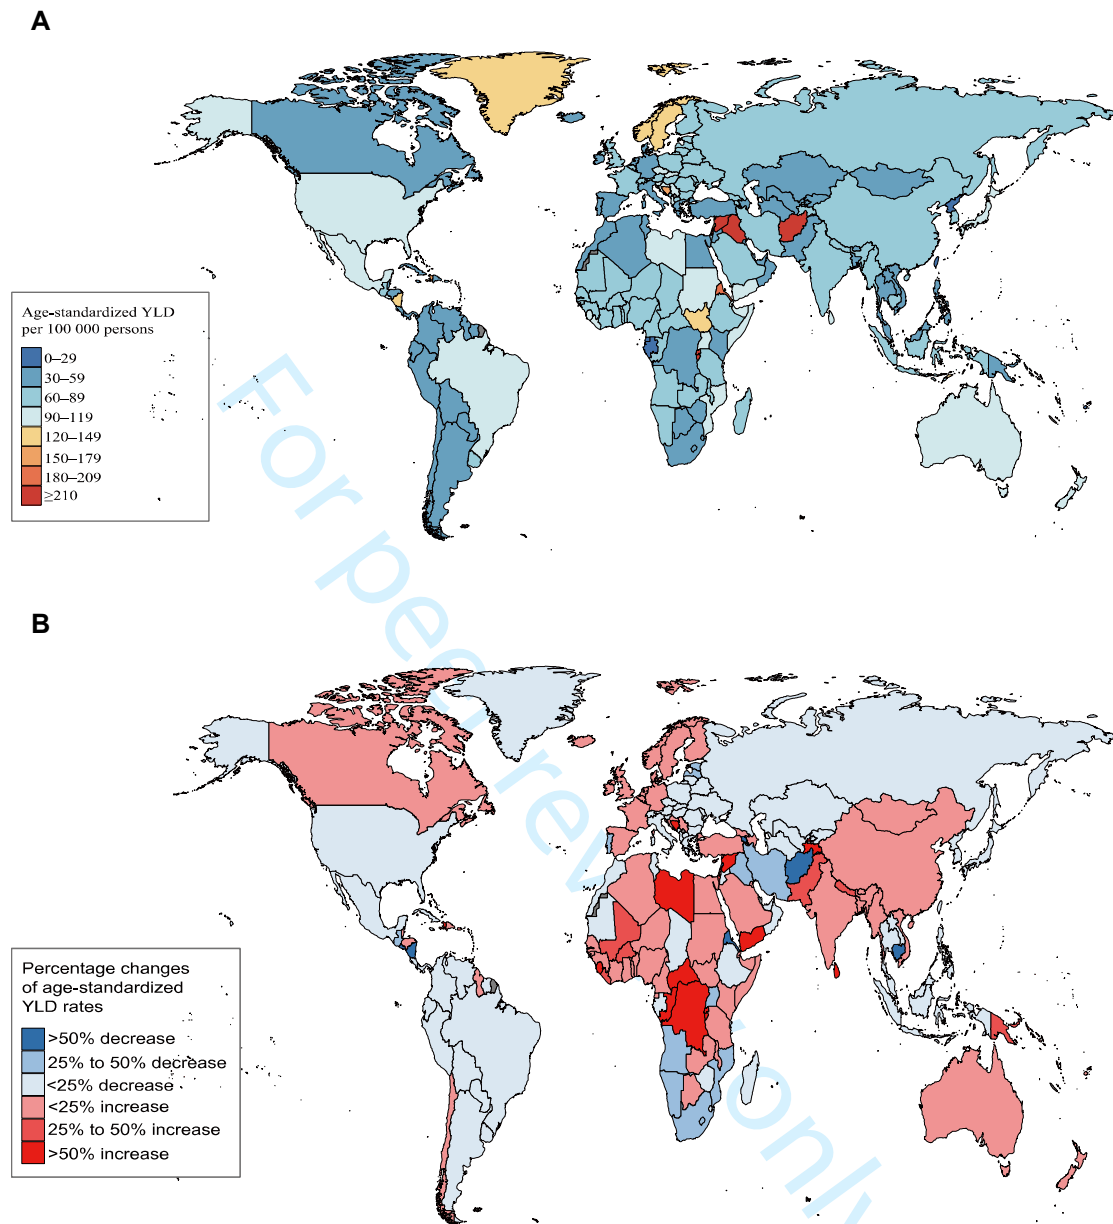

eFigure 5. Prevalence of spinal cord injury worldwide

Age-standardized prevalence estimates per 100,000 persons of spinal cord injury (SCI) by location, 2019 (A);

Percentage changes of age-standardized prevalence estimates of SCI, 1990–2019 (B)

eFigure 6. Years lived with disability of spinal cord injury world

Age-standardized years lived with disability (YLDs) rates per 100,000 persons of spinal cord injury (SCI) by location, 2019 (A); Percentage changes of age-standardized YLD rates of SCI, 1990–2019 (B)

eFigure 7. Associations between Socio-demographic Index (SDI) and age-standardized years lived with disability (YLDs) rates of traumatic brain injury and spinal cord injury in 204 countries and territories

Associations between Socio-demographic Index (SDI) and age-standardized years lived with disability (YLDs) rates of traumatic brain injury (A) and spinal cord injury (B) in 204 countries and territories, 2019; each point is plotted for each country/territory and shows observed age-standardized YLD rates for that country/territory in 2019; expected values based on SDI and disease rates in all countries and territories are shown as the black line; the name of each country/territory is represented by its ISO3 codes; ISO3 codes of 204 countries and territories are presented in **eTable 7**

Table 2. Global Burden of Disease severity hierarchy for nature-of-injury

Rank	Inpatient hierarchy	Outpatient hierarchy
1	Spinal cord lesion below neck level	Fracture of pelvis
2	Amputation of lower limbs, bilateral	Fracture of patella, tibia or fibula, or ankle
3	Amputation of upper limbs, bilateral	Fracture of hip
4	Spinal cord lesion at neck level	Fracture of skull
5	Fracture of hip	Amputation of thumb
6	Fracture of femur, other than femoral neck	Fracture of vertebral column
7	Amputation of upper limb, unilateral	Multiple fractures, dislocations, crashes, wounds, sprains, and strains
8	Amputation of lower limb, unilateral	Internal hemorrhage in abdomen and pelvis
9	Multiple fractures, dislocations, crashes, wounds, sprains, and strains	Fracture of femur, other than femoral neck
10	Effect of different environmental factors	Dislocation of hip
11	Fracture of patella, tibia or fibula, or ankle	Amputation of toe/toes
12	Moderate-Severe traumatic brain injury	Fracture of hand (wrist and other distal part of hand)
13	Fracture of foot bones except ankle	Amputation of fingers (excluding thumb)
14	Internal hemorrhage in abdomen and pelvis	Burns, <20% of total burned surface area without lower airway burns
15	Crush injury	Dislocation of knee
16	Minor traumatic brain injury	Contusion in any part of the body
17	Fracture of pelvis	Minor traumatic brain injury
18	Nerve injury	Foreign body in respiratory system
19	Severe chest injury	Severe chest injury
20	Dislocation of hip	Drowning and nonfatal submersion
21	Burns, $\geq 20\%$ total burned surface area or $\geq 10\%$ burned surface area if head/neck or hands/wrist involved w/o lower airway burns	Asphyxiation
22	Lower airway burns	Poisoning requiring urgent care
23	Fracture of skull	Effect of different environmental factors
24	Amputation of thumb	Foreign body in GI and urogenital system
25	Fracture of hand (wrist and other distal part of hand)	Fracture of sternum and/or fracture of one or more ribs
26	Fracture of vertebral column	Nerve injury
27	Contusion in any part of the body	Fracture of face bones
28	Open wound(s)	Dislocation of shoulder
29	Amputation of toe/toes	Injury to eyes
30	Dislocation of knee	Fracture of clavicle, scapula, or humerus
31	Amputation of fingers (excluding thumb)	Fracture of radius and/or ulna
32	Drowning and nonfatal submersion	Fracture of foot bones except ankle
33	Asphyxiation	Foreign body in ear

Rank	Inpatient hierarchy	Outpatient hierarchy
34	Burns, <20% total burned surface area without lower airway burns	Muscle and tendon injuries, including sprains and strains lesser dislocations
35	Muscle and tendon injuries, including sprains and strains lesser dislocations	Superficial injury of any part of the body
36	Fracture of face bones	Open wound(s)
37	Foreign body in respiratory system	Complications following therapeutic procedures
38	Poisoning requiring urgent care	
39	Foreign body in GI and urogenital system	
40	Fracture of sternum and/or fracture of one or more ribs	
41	Dislocation of shoulder	
42	Injury to eyes	
43	Fracture of clavicle, scapula, or humerus	
44	Fracture of radius and/or ulna	
45	Foreign body in ear	
46	Superficial injury of any part of the body	
47	Complications following therapeutic procedures	

Table 3. Global Burden of Disease lay descriptions and disability weights for health states

Health state	Lay description	Disability weight
Concussion	has headaches, dizziness, nausea and difficulty concentrating.	0.110 (0.074–0.158)
Severe traumatic brain injury: short term, with or without treatment	cannot concentrate and has headaches, memory problems, dizziness, and feels angry.	0.214 (0.141–0.297)
Traumatic brain injury: long-term consequences, minor, with or without treatment	has episodes of headaches, memory problems, and difficulty concentrating.	0.094 (0.063–0.133)
Traumatic brain injury: long-term consequences, moderate, with or without treatment	has frequent headaches, memory problems, difficulty concentrating, and dizziness. The person is often anxious and moody.	0.231 (0.156–0.324)
Traumatic brain injury: long-term consequences, severe, with or without treatment	cannot think clearly and has frequent headaches, memory problems, difficulty concentrating and dizziness. The person is often anxious and moody, and depends on others for feeding, toileting, dressing and walking.	0.637 (0.462–0.789)
Spinal cord lesion below neck: treated	is paralyzed from the waist down, cannot feel or move the legs and has difficulties with urine and bowel control. The person uses a wheelchair to move around.	0.296 (0.198–0.414)
Spinal cord lesion below neck: untreated	is paralyzed from the waist down, cannot feel or move the legs and has difficulties with urine and bowel control. Legs are in fixed, bent positions, and the person gets frequent infections and pressure sores.	0.623 (0.434–0.777)
Spinal cord lesion at neck: treated	is paralyzed from the neck down, with no feeling or control over any part of the body below the neck, and no urine or bowel control.	0.589 (0.415–0.748)
Spinal cord lesion at neck: untreated	is paralyzed from the neck down, with no feeling or control over any part of the body below the neck, and no urine or bowel control. Arms and legs are in fixed, bent positions, and the person gets frequent infections and pressure sores.	0.732 (0.544–0.871)

eTable 6. Global Burden of Disease (GBD) cause hierarchy with levels for injuries

Cause	Level
Injuries	1
Transport injuries	2
Road injuries	3
Pedestrian road injuries	4
Cyclist road injuries	4
Motorcyclist road injuries	4
Motor vehicle road injuries	4
Other road injuries	4
Other transport injuries	3
Unintentional injuries	2
Falls	3
Drowning	3
Fire, heat, and hot substances	3
Poisonings	3
Poisoning by carbon monoxide	4
Poisoning by other means	4
Exposure to mechanical forces	3
Unintentional firearm injuries	4
Other exposure to mechanical forces	4
Adverse effects of medical treatment	3
Animal contact	3
Venomous animal contact	4
Non-venomous animal contact	4
Foreign body	3
Pulmonary aspiration and foreign body in airway	4
Foreign body in eyes	4
Foreign body in other body part	4
Environmental heat and cold exposure	3
Exposure to forces of nature	3
Other unintentional injuries	3
Self-harm and interpersonal violence	2
Self-harm	3
Self-harm by firearm	4
Self-harm by other specified means	4
Interpersonal violence	3
Physical violence by firearm	4
Physical violence by sharp object	4
Physical violence by other means	4
Conflict and terrorism	3
Executions and police conflict	3

The 29 causes in **bold** (they were called the most detailed causes in the GBD 2019 study) were analyzed in our study, which was consistent with the statistical analysis in the previous GBD 2016 study published in The Lancet Neurology.

28	Zimbabwe	Self-harm by other specified means	0 (0 to 0)	0 (0 to 0)	30.6% (24.3% to 37.1%)
29	Zimbabwe	Unintentional firearm injuries	0 (0 to 0)	0 (0 to 0)	-5.8% (-12.8% to 1.9%)
30	Zimbabwe	Venomous animal contact	0 (0 to 0)	0 (0 to 0)	16.5% (8.6% to 25.3%)

Abbreviations: UI, uncertainty interval; NA, not applicable

Checklist of information that should be included in new reports of global health estimates

Item #	Checklist item	Reported on page #
Objectives and funding		
1	Define the indicator(s), populations (including age, sex, and geographic entities), and time period(s) for which estimates were made.	Main Pg. 5-10
2	List the funding sources for the work.	Main Pg. 22
Data Inputs		
<i>For all data inputs from multiple sources that are synthesized as part of the study:</i>		
3	Describe how the data were identified and how the data were accessed.	Main Pg. 5-10
4	Specify the inclusion and exclusion criteria. Identify all ad-hoc exclusions.	Main Pg. 6-7 https://ghdx.healthdata.org/gbd-2019/data-input-sources
5	Provide information on all included data sources and their main characteristics. For each data source used, report reference information or contact name/institution, population represented, data collection method, year(s) of data collection, sex and age range, diagnostic criteria or measurement method, and sample size, as relevant.	Main Pg. 6-7 https://ghdx.healthdata.org/gbd-2019/data-input-sources
6	Identify and describe any categories of input data that have potentially important biases (e.g., based on characteristics listed in item 5).	https://ghdx.healthdata.org/gbd-2019/data-input-sources https://ghdx.healthdata.org/gbd-2019/code
<i>For data inputs that contribute to the analysis but were not synthesized as part of the study:</i>		
7	Describe and give sources for any other data inputs.	N/A
<i>For all data inputs:</i>		
8	Provide all data inputs in a file format from which data can be efficiently extracted (e.g., a spreadsheet rather than a PDF), including all relevant meta-data listed in item 5. For any data inputs that cannot be shared because of ethical or legal reasons, such as third-party ownership, provide a contact name or the name of the institution that retains the right to the data.	https://ghdx.healthdata.org/gbd-2019/data-input-sources
Data analysis		
9	Provide a conceptual overview of the data analysis method. A diagram may be helpful.	Main Pg. 9-10

10	Provide a detailed description of all steps of the analysis, including mathematical formulae. This description should cover, as relevant, data cleaning, data pre-processing, data adjustments and weighting of data sources, and mathematical or statistical model(s).	Main Pg. 9-10 https://ghdx.healthdata.org/gbd-2019/code
11	Describe how candidate models were evaluated and how the final model(s) were selected.	N/A
12	Provide the results of an evaluation of model performance, if done, as well as the results of any relevant sensitivity analysis.	N/A
13	Describe methods for calculating uncertainty of the estimates. State which sources of uncertainty were, and were not, accounted for in the uncertainty analysis.	Main Pg. 8-9
14	State how analytic or statistical source code used to generate estimates can be accessed.	https://ghdx.healthdata.org/gbd-2019/code
Results and Discussion		
15	Provide published estimates in a file format from which data can be efficiently extracted.	https://vizhub.healthdata.org/gbd-results/
16	Report a quantitative measure of the uncertainty of the estimates (e.g. uncertainty intervals).	Main Pg. 10-13
17	Interpret results in light of existing evidence. If updating a previous set of estimates, describe the reasons for changes in estimates.	Main Pg. 13-17
18	Discuss limitations of the estimates. Include a discussion of any modelling assumptions or data limitations that affect interpretation of the estimates.	Main Pg. 17-20

This checklist should be used in conjunction with the GATHER statement and Explanation and Elaboration document, found on gather-statement.org

STROBE Statement—Checklist of items that should be included in reports of *cross-sectional studies*

	Item No	Recommendation	Page No
Title and abstract	1	(a) Indicate the study's design with a commonly used term in the title or the abstract	Main Pg. 2
		(b) Provide in the abstract an informative and balanced summary of what was done and what was found	Main Pg. 2
Introduction			
Background/rationale	2	Explain the scientific background and rationale for the investigation being reported	Main Pg. 4-5
Objectives	3	State specific objectives, including any prespecified hypotheses	Main Pg. 5
Methods			
Study design	4	Present key elements of study design early in the paper	Main Pg. 5-6
Setting	5	Describe the setting, locations, and relevant dates, including periods of recruitment, exposure, follow-up, and data collection	Main Pg. 6-7 https://ghdx.healthdata.org/gbd-2019/data-input-sources
Participants	6	(a) Give the eligibility criteria, and the sources and methods of selection of participants	Main Pg. 6-7 https://ghdx.healthdata.org/gbd-2019/data-input-sources
Variables	7	Clearly define all outcomes, exposures, predictors, potential confounders, and effect modifiers. Give diagnostic criteria, if applicable	Main Pg. 7-9 https://vizhub.healthdata.org/gbd-results/
Data sources/ measurement	8*	For each variable of interest, give sources of data and details of methods of assessment (measurement). Describe comparability of assessment methods if there is more than one group	Main Pg. 6-7 https://vizhub.healthdata.org/gbd-results/
Bias	9	Describe any efforts to address potential sources of bias	https://ghdx.healthdata.org/gbd-2019/data-input-sources

			https://ghdx.healthdata.org/gbd-2019/code
Study size	10	Explain how the study size was arrived at	N/A
Quantitative variables	11	Explain how quantitative variables were handled in the analyses. If applicable, describe which groupings were chosen and why	Main Pg. 7-9 https://ghdx.healthdata.org/gbd-2019/code
Statistical methods	12	(a) Describe all statistical methods, including those used to control for confounding	Main Pg. 9-10 https://ghdx.healthdata.org/gbd-2019/code
		(b) Describe any methods used to examine subgroups and interactions	N/A
		(c) Explain how missing data were addressed	N/A
		(d) If applicable, describe analytical methods taking account of sampling strategy	N/A
		(e) Describe any sensitivity analyses	N/A
Results			
Participants	13*	(a) Report numbers of individuals at each stage of study—eg numbers potentially eligible, examined for eligibility, confirmed eligible, included in the study, completing follow-up, and analysed	https://ghdx.healthdata.org/gbd-2019/data-input-sources https://ghdx.healthdata.org/gbd-2019/code
		(b) Give reasons for non-participation at each stage	https://ghdx.healthdata.org/gbd-2019/data-input-sources https://ghdx.healthdata.org/gbd-2019/code
		(c) Consider use of a flow diagram	https://ghdx.healthdata.org/gbd-2019/data-input-sources https://ghdx.healthdata.org/gbd-2019/code
Descriptive data	14*	(a) Give characteristics of study participants (eg demographic, clinical, social) and information on exposures and potential confounders	Main Pg. 10-13

		(b) Indicate number of participants with missing data for each variable of interest	N/A
Outcome data	15*	Report numbers of outcome events or summary measures	Main Pg. 10-13
Main results	16	(a) Give unadjusted estimates and, if applicable, confounder-adjusted estimates and their precision (eg, 95% confidence interval). Make clear which confounders were adjusted for and why they were included	Main Pg. 10-13
		(b) Report category boundaries when continuous variables were categorized	N/A
		(c) If relevant, consider translating estimates of relative risk into absolute risk for a meaningful time period	N/A
Other analyses	17	Report other analyses done—eg analyses of subgroups and interactions, and sensitivity analyses	N/A
Discussion			
Key results	18	Summarise key results with reference to study objectives	Main Pg. 13-17
Limitations	19	Discuss limitations of the study, taking into account sources of potential bias or imprecision. Discuss both direction and magnitude of any potential bias	Main Pg. 17-20
Interpretation	20	Give a cautious overall interpretation of results considering objectives, limitations, multiplicity of analyses, results from similar studies, and other relevant evidence	Main Pg. 20-22
Generalisability	21	Discuss the generalisability (external validity) of the study results	Main Pg. 20-22
Other information			
Funding	22	Give the source of funding and	Main Pg. 22

the role of the funders for the present study and, if applicable, for the original study on which the present article is based	
--------------------------------------------------------------------------------------------------------------------------------	--

*Give information separately for exposed and unexposed groups.

Note: An Explanation and Elaboration article discusses each checklist item and gives methodological background and published examples of transparent reporting. The STROBE checklist is best used in conjunction with this article (freely available on the Web sites of PLoS Medicine at <http://www.plosmedicine.org/>, Annals of Internal Medicine at <http://www.annals.org/>, and Epidemiology at <http://www.epidem.com/>). Information on the STROBE Initiative is available at www.strobe-statement.org.
