

Supplemental Table 2. The Association between MD and Serial Changes of Circumpapillary CD at Various Levels of Negative Pressure During the “Ramp-up” and “Ramp-down” Schedule (N = 24 eyes)

Negative Pressure (mmHg)	Coefficient (%/dB) (95% CI)	P value*
-5	0.51 (-0.60, 1.62)	0.365
-10	0.52 (-0.59, 1.63)	0.360
-15	0.57 (-0.54, 1.68)	0.312
-20	0.01 (-1.10, 1.12)	0.988
-15	0.56 (-0.55, 1.67)	0.323
-10	0.35 (-0.76, 1.46)	0.535
-5	0.64 (-0.47, 1.75)	0.259
0	0.23 (-0.88, 1.34)	0.682

MD: mean deviation, CD: capillary density.

Linear mixed effects model with repeated measures was used to evaluate the association between MD and circumpapillary CD at various levels of negative pressure.
