Comments to author:

The presented case-report is a very good example for these rare postoperative complication. Handling of the situation and treatment was very concise and is appropriate to spread the knowledge about invagination and intussusception. I would suggest to publish the contribution in the presented form without any further correction.

Comments to author:

Nice presentation of a rare, but significant complication in surgery for Crohn's disease. The readers of the article get relevant information about this complication and may consider it when treating patients with a somewhat complicated postoperative course after surgery for Crohn's disease.

I recommend a publication in present form.
