Supplementary Methods. Details of trial methods.

Details of the covariate-constrained randomization method.

In this trial 37 nephrology services were randomized, and each service varied in size. Some services had fewer haemodialysis patients, others had more, and the number of catheters used in each service therefore also varied. If randomization of services was performed without considering these differences in catheter use, it is possible that substantial imbalance in the average number of catheters in each of the three tranches could occur by chance, which would reduce the power of the study. To mitigate this possibility, baseline data on the number of catheters used at each service (from Dec 2016 – Jan 2018) was incorporated into the randomization process. Specifically,100,000 random allocation sequences were generated and those sequences in which the average number of catheters per service in each tranche were balanced (within 10% of the overall trial average) were retained. Of the original sequences generated, 6865 met the balance criteria, and the final randomization allocation was randomly chosen from this subset.

Details of the trial intervention.

The catheter management interventions were developed by a trial Sub-committee following an independent evidence-based review and were finalized in January 2018. Haemodialysis catheter-related bloodstream infections were the primary consideration in designing the interventions, however non-infectious catheter complications were also considered as secondary outcomes of interest. Two local champions, consisting of one physician and one nurse, were identified at each nephrology service, and were tasked with implementing the intervention at their service.

1. At the time of catheter insertion

- 1.1. Surgical aseptic technique (hand hygiene, sterile gloves, surgical mask, eye protection and gown), and a sterile environment (sterile surgical field on the patient) and/or a sterile room as per unit availability **MUST** be applied.
- 1.2. An antiseptic solution using a minimum of 2% chlorhexidine with 70% alcohol MUST be used
 - 1.2.1. For those who cannot tolerate chlorhexidine, povidone—iodine or 70% alcohol may be used
- 1.3. Site of insertion
 - 1.3.1. The right internal jugular vein is the best site for catheter insertion
 - 1.3.2. Catheters in the subclavian vein should be avoided due to incidence of central vein stenosis.
 - 1.3.3. Avoid femoral catheters where possible
- 1.4. We do not recommend any specific catheter type
- 1.5. Ultrasound guided catheter placement is recommended if the resources are available
- 1.6. Semi permeable transparent dressing **MUST** be applied to the line. If a patient is allergic to these dressings, then an alternative appropriate dressing may be used.
- 1.7. All patients MUST receive education on the following topics
 - 1.7.1. Vascular access care
 - 1.7.2. Hand hygiene
 - 1.7.3. Risks related to catheter use
 - 1.7.4. Recognizing signs of infection
 - 1.7.5. Instructions for access management when away from the dialysis unit
 - 1.7.6. To ensure that their catheter and exit site are kept dry.
 - 1.7.7. To seek assistance from dialysis should a dressing become wet, soiled or leak, or if the catheter itself begins to slip out
 - 1.7.8. To **NOT** shower in the first 72 hours after catheter insertion. After 72 hours, in order to have a shower, the catheter site must be covered with waterproof material.
- 1.8. All patients **SHOULD** receive a copy of the REDUCCTION catheter care sheet

2. Catheter maintenance

- 2.1. Hand hygiene, sterile gloves, a plastic apron, and aseptic technique (hand hygiene, gloves) **MUST** be applied at all occasions of catheter access
 - 2.1.1. An antiseptic solution using a minimum of 2% chlorhexidine with 70% alcohol must be used
 - 2.1.2. For those unable to tolerate chlorhexidine, povidone—iodine or 70% alcohol may be used
- 2.2. Dressing must be changed at least every 7 days and each time the dressing appears visibly soiled or loose
- 2.3. We do **NOT** recommend the routine use of mupirocin ointment or medicated honey at the catheter exit site.
- 2.4. All units **MUST** use **at least one** of the following specific interventions aimed at prophylaxis against catheter related bacteraemia*
 - 2.4.1. Impregnated dressings (such as chlorhexidine impregnated patch or sponge) at the catheter exit site and/or
 - 2.4.2. Anti-microbial (e.g. citrate or taurolidine based) or anti-bacterial (e.g. gentamicin) catheter locking solutions #
- 2.5. All patients must be advised to ensure that their catheter and exit site are kept dry. Patients must be advised to seek assistance from dialysis should a dressing become wet, soiled or leak, or if the catheter itself begins to slip out.
- 2.6. All patients should receive a copy of the REDUCCTION catheter care sheet as above
- 2.7. All patients must receive education on the following topics
 - 2.7.1. Vascular access care
 - 2.7.2. Hand hygiene
 - 2.7.3. Risks related to catheter use
 - 2.7.4. Recognizing signs of infection
 - 2.7.5. Instructions for access management when away from the dialysis unit
- 2.8. All patients must be advised NOT to shower in the first 72 hours after catheter insertion. After 72 hours, in order to have a shower, the catheter site must be covered with waterproof material.

*check manufacturer's instructions when choosing the intervention to ensure compatibility with catheters #with the use of gentamicin locks, monitoring of antibiotic resistance should be considered as per hospital policy

3. Catheter removal

- 3.1. Catheters **MUST** be removed as soon as it is clinically identified that they are no longer needed and within a maximum of 2 weeks of their last use.
- 3.2. Non-Tunnelled catheters should be changed to tunnelled catheters as soon as possible. Non-tunnelled femoral catheters should not be in place for more than 5 days, and non-tunnelled upper limb catheters—should not be in place for more than 7 days.
- 3.3. Catheters must be removed when there are signs of catheter related infections except in extenuating cases
- 3.4. Re-wiring of catheters is **NOT** recommended in the setting of any catheter related infection

Supplementary Table S1. Baseline characteristics of tunnelled catheters during baseline, intervention or both phases.

Allocation 9 Specification that allocation was based on clusters; description of any methods used to conceal the allocation from the clusters until after recruitment. Implementation 10 Who generated the randomisation schedule, who enrolled clusters, and who assigned clusters to sequences. 10b Mechanism by which individual participants were included in clusters for the purposes of the trial (such as complete enumeration, random sampling; continuous recruitment or ascertainment; or recruitment at a fixed point in time), including who recruited or identified participants. 10c Whether, from whom and when consent was sought and for what; whether this differed between treatment conditions. 11d If done, who was blinded after assignment to sequences (eg, cluster level participants, individual level participants, those assessing outcomes) and how. 11b If relevant, description of the similarity of treatments. Statistical methods 12b Methods for additional analyses, such as subgroup analyses, sensitivity		4b		
including how and when they were assessed. Any changes to trial outcomes after the trial commenced, with reasons. Sample size Any changes to trial outcomes after the trial commenced, with reasons. How sample size was determined. Method of calculation and relevant parameters with sufficient detail so the calculation can be replicated. Assumptions made about correlations between outcomes of participants from the same cluster. (see separate checklist for SW-CRT sample size items). The when applicable, explanation of any interim analyses and stopping guidelines. Randomisation Randomisation Begeneration Method used to generate the random allocation to the sequences of treatments. By of randomisation; details of any constrained randomisation or stratification, if used. Allocation Specification that allocation was based on clusters; description of any methods used to conceal the allocation from the clusters until after recruitment. Implementation 10a Mechanism by which individual participants were included in clusters of the purposes of the trial (such as complete enumeration, random sampling; continuous recruitment or ascertainment; or recruitment at a fixed point in time), including who recruited or identified participants. Whether, from whom and when consent was sought and for what; whether this differed between treatment conditions. Blinding 11a If done, who was blinded after assignment to sequences (eg, cluster level participants, individual level participants, those assessing outcomes) and how. 11b If relevant, description of the similarity of treatments. Statistical methods 22a Statistical methods used to compare treatment conditions for primary and secondary outcomes including how time effects, clustering and repeated measures were taken into account. Methods for additional analyses, such as subgroup analyses, sensitivity	Interventions	5	replication, including whether the intervention was maintained or repeated, and whether it was delivered at the cluster level, the individual participant level, or both.	
How sample size was determined. Method of calculation and relevant parameters with sufficient detail so the calculation can be replicated. Participant flow (a diagram is strongly recommended)	13a	For each treatment condition or allocated sequence, the numbers of clusters and participants who were assessed for eligibility, were randomly assigned, received intended treatments, and were analysed for the primary outcome (see separate SW-CRT flow chart).	
	13b	For each treatment condition or allocated sequence, losses and exclusions for both clusters and participants with reasons.	
Recruitment	14a	Dates defining the steps, initiation of intervention, and deviations from planned dates. Dates defining recruitment and follow-up for participants.	
	14b	Why the trial ended or was stopped.	
Baseline data	15	Baseline characteristics for the individual and cluster levels as applicable for each treatment condition or allocated sequence.	
Numbers analysed	16	The number of observations and clusters included in each analysis for each treatment condition and whether the analysis was according to the allocated schedule.	
Outcomes and estimation	17a	For each primary and secondary outcome, results for each treatment condition, and the estimated effect size and its precision (such as 95% confidence interval); any correlations (or covariances) and time effects estimated in the analysis.	
	17b	For binary outcomes, presentation of both absolute and relative effect sizes is recommended.	
Ancillary analyses	18	Results of any other analyses performed, including subgroup analyses and adjusted analyses, distinguishing prespecified from exploratory.	
Harms	19	Important harms or unintended effects in each treatment condition (for specific guidance see CONSORT for harms).	
Discussion			
Limitations	20	Trial limitations, addressing sources of potential bias, imprecision, and, if relevant, multiplicity of analyses.	
Generalisability	21	Generalisability (external validity, applicability) of the trial findings. Generalisability to clusters or individual participants, or both (as relevant).	
Interpretation	22	Interpretation consistent with results, balancing benefits and harms, and considering other relevant evidence.	
Other information			
Registration	23	Registration number and name of trial registry.	
rotocol	24	Where the full trial protocol can be accessed, if available.	
unding	25	Sources of funding and other support (such as supply of drugs), and the role of funders.	
Research ethics review	26	Whether the study was approved by a research ethics committee, with identification of the review committee(s). Justification for any waiver or modification of informed consent requirements.
