

Supplementary Materials

Figure S1. Assessment of Dose Proportionality for Plasma NHC (A) AUC_{0-12} and (B) C_{max} on Day 11 Following Administration of Multiple Oral Doses of Molnupiravir Every 12 Hours for 10.5 Days to Healthy Participants ($n = 6$ for 400 mg, $n = 6$ for 600 mg, $n = 12$ for 800 mg)

A

B

CI, confidence interval; NHC, β -D-N4-hydroxycytidine

A true slope of 1.0 indicates perfect dose proportionality. Least-squares estimate and confidence interval from linear mixed-effects model including \ln -dose as a continuous effect, performed on natural log-transformed values.
