Supplementary Text

Supplementary Note 1: Detailed description of the X-ray crystal structures of M^{pro} inhibitor complexes

The structures of Calpeptin and GC-376 bound to M^{pro} were previously described¹⁻⁴. Calpeptin binds covalently to Cys¹⁴⁵ of M^{pro} (PDB: 7AKU)¹ with its aldehyde group, forming a thiohemiacetal with an interatomic S-O distance of 1.8 Å (Figure S2F)^{5,6}. This structure was solved in a monoclinic space group, where Calpeptin occupies the S1 to S3 pockets. Overall, the

27 peptidomimetic backbone of Calpeptin forms hydrogen bonds corresponding to the native peptide
28 substrate⁷. The backbone carbonyl of His¹⁶⁴ forms a hydrogen bond to the peptidomimetic
29 Calpeptin amide-nitrogen of the norleucine residue-analog (Figure S12). The terminal ester
30 carbonyl forms a hydrogen bond with the backbone nitrogen of Glu¹⁶⁶. The norleucine side chain
31 exhibits van der Waals contacts with the backbone of Phe¹⁴⁰, Leu¹⁴¹, and Asn¹⁴². The terminal
32 Cbz-group is oriented to the S3 pocket between the side chains of Glu¹⁶⁶ and Gln¹⁸⁹ and exhibits
33 hydrophobic interactions with norleucine (Figure S2F). The structure of GC-376 aldehyde bound
34 to M^{pro} solved in a monoclinic space group (PDB: 7QKA) resembles this conformation.
35 Substitution of norleucine by 2-oxopyrrolidine leads to additional hydrogen bonds to His¹⁶³ and
36 Glu¹⁶⁶(Figure S2H). In addition to the monoclinic form with one monomer per asymmetric unit,
37 M^{pro} also crystallizes in an orthorhombic space group containing two monomers per asymmetric
38 unit⁸ and the two monomers within the dimer exhibit structural variations. The structure of
39 Calpeptin derived from S-Calpeptin bound to M^{pro} was solved in an orthorhombic space group
40 (PDB 7Z3U) and shows more flexibility with respect to the conformation of the Cbz- group
41 (Figure S2D). This group is oriented in the S4 pocket in one monomer, while it exhibits an
42 alternative conformation oriented to the S3 or S4 pocket in the other monomer, a similar
43 flexibility as observed for GC-376 analogs⁹. This is linked to an alternative orientation of the loop
44 containing Gln¹⁸⁹, which is shifted by about 2 Å, further opening this pocket. In addition to the
45 previously described interactions of Calpeptin, the Cbz-group interactions via hydrophobic
46 interactions with the backbone of Thr¹⁹⁰ and Gln¹⁹² are evident in the S4 pocket. In the- structure
47 co-crystallized with S-Calpeptin, the monomers exhibit a NOS-bridge, which is an oxygen-
48 mediated link between Cys²² and Lys⁶¹ (molecule B) and a SONOS-bridge, which is a three-way
49 covalent bond between Cys²², Cys⁴⁴ and Lys⁶¹ (molecule A). These covalent links in M^{pro} were
50 previously observed¹⁰.

51

52 **Supplementary Note 2: Detailed description of the X-ray crystal structures of CatK/V**

53 **Calpeptin complex**

54 The binding mode of Calpeptin to CatK (PDB: 8C3D) and CatV (PDB: 7QGW) is similar to that
55 of CatL, which can be explained by the high conservation of the active site cleft (Figure S12).

56 Small differences occur in the S3-pocket in the vicinity of the terminal Cbz-group of Calpeptin.

57 While in CatL Leu⁶⁹ and Tyr⁷² form a hydrophobic pocket in which the phenyl ring is located,

58 this hydrophobic pocket is less voluminous in CatK because it is constrained by Tyr⁶⁷ (in CatL

59 Leu⁶⁹), which is oriented toward the Cbz-group, resulting in a restriction of the pocket that forces

60 the phenyl ring towards Asp⁶¹ (in CatL Glu⁶³). CatV Phe⁶⁹ and Arg⁷² (in CatL Leu⁶⁹ and Tyr⁷²)

61 are directed towards this pocket, leading to a restriction of the pocket and forcing the phenyl ring

62 into a slightly different orientation towards Gln⁶³ (in CatL Glu⁶³).

63

64 **Supplementary Note 3: Analysis of TMPRSS2 expression by Western blot**

65 TMPRSS2 is synthesized as a single-chain zymogen and cleaves SARS-CoV-2 S protein

66 extracellularly. To determinate the expression status of endogenous TMPRSS2 during growth

67 phase we treated LC-HK2 and VERO-CCL81 cells with trypsin to remove surface proteins.

68 TMPRSS2 was barely detectable as a single band in VERO-CCL81 and detectable in LC-HK2 as

69 ~ 54-kDa band, representing the zymogen (Figure S4). We detected two additional prominent

70 bands with about ~64 kDa and ~110 kDa in human LC-HK2 probably generated by glycosylation

71 events under reducing conditions in human TMPRSS2, as previously reported (Figure S4)¹¹.

72

73 **Supplementary Note 4: Calpeptin cell experiments**

74 To test whether the viral particles are entrapped in endosomes after S-Calpeptin treatment, the

75 distribution of S-protein containing vesicle size in infected LC-HK2 cells was analyzed by

76 fluorescence microscopy. This analysis did not reveal significant differences between S-Calpeptin
77 treated cells and the control group (Figure S5).

78

79 **Supplementary Note 5: Calpeptin toxicity experiments in hamsters**

80 At the time of this study, we did not find any study that used Calpeptin in hamsters. Therefore,
81 prior to the antiviral experiment, we performed a small study to investigate if different doses of
82 Calpeptin could lead to acute toxicity in hamsters. Animals were subjected to daily subcutaneous
83 as described in the methods section. The route of administration and doses were chosen based on
84 literature reports of the use of Calpeptin in mouse studies¹²⁻¹⁸. Clinical signs and weight were
85 followed until day 6, when the animals were euthanized, necropsied, and organs were collected
86 for histopathology analysis. Treated animals did not display acute toxicity-related clinical signs or
87 weight loss during the experiment (Figure S8A and B) nor any noteworthy histopathological
88 lesion in brain, liver, pancreas, gastro-intestinal tract, kidney, lungs, spleen, or trachea. However,
89 a complete blood cell count performed on day 6 showed marked leukopenia caused by
90 lymphopenia and neutropenia in animals treated with 2 mg/kg and 3 mg/kg of S-Calpeptin
91 compared to those that received only 1 mg/kg of S-Calpeptin or 1:100 DMSO (Figure S8C-F).
92 For this reason, we opted to test the dose of 1 mg/kg of S-Calpeptin in the anti-viral animal
93 experiment (Figure S8A and B).

94

95 **Supplementary Note 6: Histopathological lesions in hamsters infected with SARS-CoV-2**

96 Corroborating previous studies¹⁹⁻²², typical histopathological lesions were seen in hamsters
97 inoculated with SARS-CoV-2 (G1 and G2). Findings in the lungs included bronchointerstitial
98 pneumonia, suppurative bronchitis, endothelialitis, necrosis of epithelial cells, and hyperplasia of
99 bronchial and alveolar type II epithelial cells (Figure S6). Occasional atypical syncytial cells were
100 seen. Areas of interstitial pulmonary fibrosis and/or inflammation were occasionally detected on

101 both infected groups. On day 7 p.i., there were higher tissue repair scores in infected animals
102 (Figure S6F), coinciding with a lower viral load in respiratory tissues and beginning of the
103 recovery phase (Figure 5). Lesions in the trachea of infected hamsters consisted of loss of cilia,
104 degeneration and/or necrosis of epithelial cells and inflammatory infiltrate in the lumen and/or in
105 the lamina propria. Histopathology analysis showed no statistically significant differences in
106 lesion scores between SARS-CoV-2 infected animals that were treated with S-Calpeptin and to
107 those that were not (Figure S7). Lung vascular lesions are a hallmark of COVID-19 in hamsters²¹.
108 Although S-Calpeptin-treated animals showed lower scores for vascular damage compared to the
109 untreated group on days 5 and 7 p.i., these results were also not statistically significant (Figure
110 S7). As expected, the lungs and trachea of hamsters from control groups (G3 and G4) were
111 unremarkable.

163 **Figure S1.**

164 **Activation of the prodrugs S-Calpeptin and GC-376.** (a) S-Calpeptin and (b) GC-376 contain a
 165 sulfonated aldehyde, which under physiological conditions slowly converts into hydrogensulfite
 166 and the aldehyde, thereby unmasking the warhead. The aldehyde warhead binds covalently to
 167 catalytic cysteines of cathepsins and M^{Pro}.

M^{Pro} with bound S-Calpeptin, PDB: 7Z3U

Molecule A: Refinement 2Fo-Fc map, 0.5 σ -level

Molecule B: Refinement 2Fo-Fc map, 0.5 σ -level

Surface and cartoon depiction, superimposed monomers of AU

Superimposed cartoon:

Superimposed surface:

Structure and ligand features

PDB structure code: 7Z3U

PDB Ligand code: RN2

Resolution: 1.72 Å

R_{work}/R_{free}: 0.19/0.22

Space group: 19 (P 21 21 21)

Unit cell: 67.69 Å, 99.60 Å, 103.26 Å, 90.00°, 90.00°, 90.00°

Occupancy: 0.47 (AA), 0.53 (AB), 1.0 (B)

Ligand RSCC/RSR: 0.86/0.17, 0.86/0.17 (A, B)

Cathepsin V with bound S-Calpeptin, PDB: 7QGW

Molecule A: Refinement 2Fo-Fc map, 1.0 σ -level

Molecule B: Refinement 2Fo-Fc map, 1.0 σ -level

Surface and cartoon depiction, superimposed monomers of AU

Superimposed Cartoon:

Superimposed surface:

Structure and ligand features

PDB structure code: 7QGW

PDB Ligand code: RN2

Resolution: 1.3 Å

R_{work}/R_{kick}: 0.17/0.20

Space group: 96 (P 43 21 2)

Unit cell: 94.24 Å, 94.24 Å, 126.96 Å, 90.0°, 90.0°, 90.0°

Occupancy: 1.0, 1.0 (A, B)

Ligand RSCC/RSR: 0.92/0.09, 0.93/0.09 (A, B)

Cathepsin K with bound S-Calpeptin (activated), PDB: 8C3D

Molecule A: Refinement 2Fo-Fc map, 1.0 σ -level

Surface and cartoon depiction

Superimposed Cartoon:

Superimposed surface:

Structure and ligand features

PDB structure code: 7QGW

PDB Ligand code: RN2

Resolution: 1.3 Å

R_{work}/R_{kick}: 0.17/0.20

Space group: 96 (P 43 21 2)

Unit cell: 94.24 Å, 94.24 Å, 126.96 Å, 90.0°, 90.0°, 90.0°

Occupancy: 1.0, 1.0 (A, B)

Ligand RSCC/RSR: 0.92/0.09, 0.93/0.09 (A, B)

308 **Table S1.**
 309 **Score system for histopathological analysis.** Parameters and scores for semiquantitative
 310 histopathological evaluation of lungs from hamsters experimentally infected with SARS-CoV-2.
 311

Parameter	Scores	
	<i>Bronchi</i>	<i>Pulmonary parenchyma</i>
Epithelial damage	0 - normal	0 - normal
	1 - degeneration (cuboidal cells)	1 - degeneration (cuboidal cells) and/or
	2 - epithelial detachment	peribronchiolar inflammatory infiltrate
	3 - necrosis and sloughing	2 - epithelial detachment
		3 - necrosis and sloughing and/or bronchiolar inflammatory infiltrate
Submucosal damage	0 - normal	
	1 - edema, vascular ectasia, or mild inflammatory infiltrate affecting 10-33% of the examined area	
	2 - moderate inflammatory infiltrate affecting 34-66% of the examined area	
	3 - marked inflammatory infiltrate affecting >67% of the examined area	
Vascular damage	0 - normal	
	1 - perivascular edema and/or endothelial hypertrophy	
	2 - mild perivascular inflammatory infiltrate and/or endothelialitis	
	3 - inflammatory infiltrate in the vascular wall and/or below the endothelium (vasculitis)	
Tissue repair	0 - normal	
	1 - repair with pre-ciliated cells and/or hyperplasia of non-ciliated epithelium	
	2 - hyperplasia of alveolar type II epithelial cells with or without atypia	
	3 - hyperplasia of goblet cells, and/or presence of granulation tissue and/or fibrosis
