#### **This PDF file includes:**

Figures S1 to S8  
Table S1

**Figure S1. Multiple sequence alignment of SERT, DAT and NET orthologues.** Residues in black are not conserved, those in red are conservatively substituted, and those in white with red background are conserved.

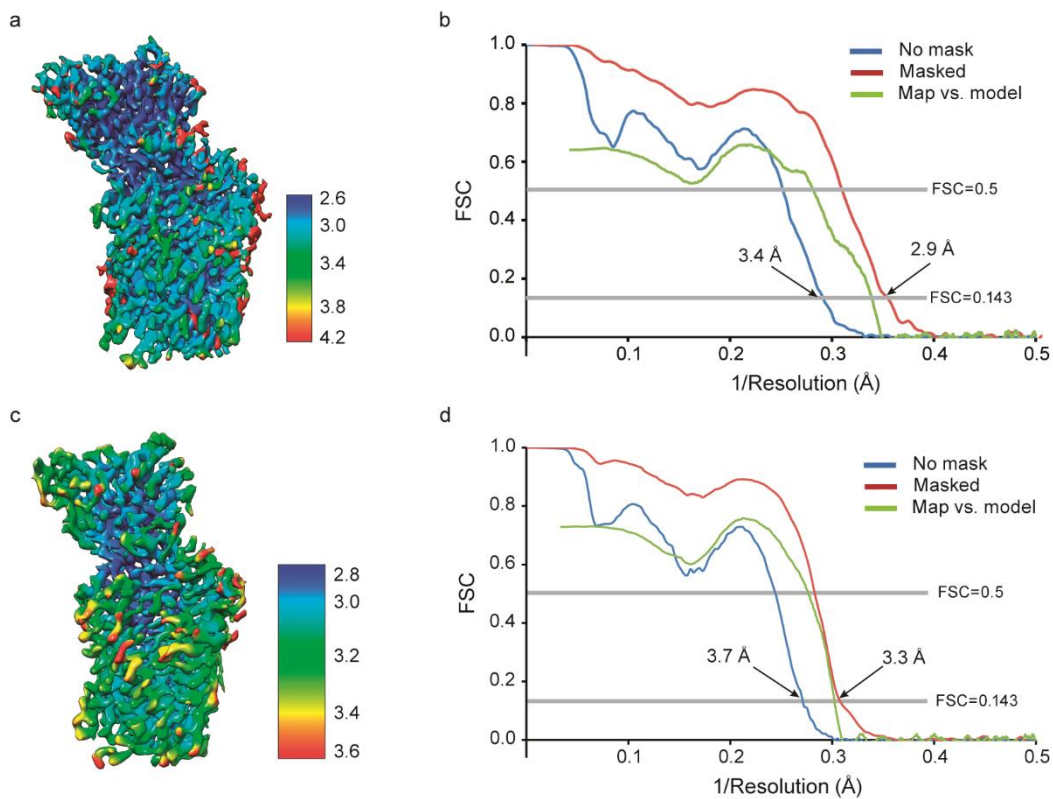

**Figure S2. 3D reconstruction of the pSERT-methamphetamine complex.** Flow chart for cryo-EM data analysis.

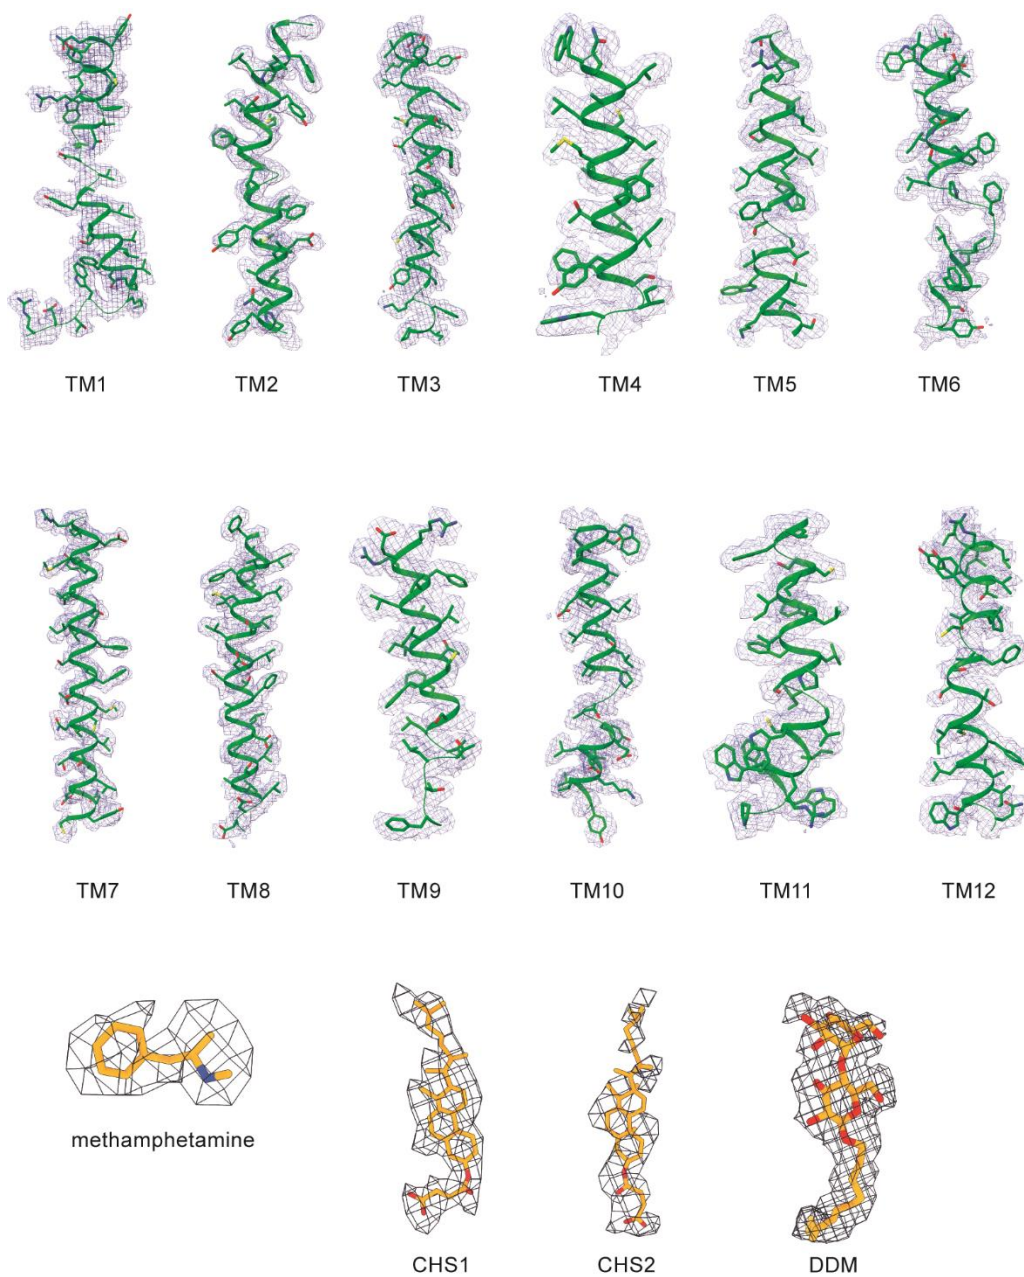

**Figure S3. Cryo-EM analysis of pSERT-cocaine complex.** Flow chart for cryo-EM data analysis.

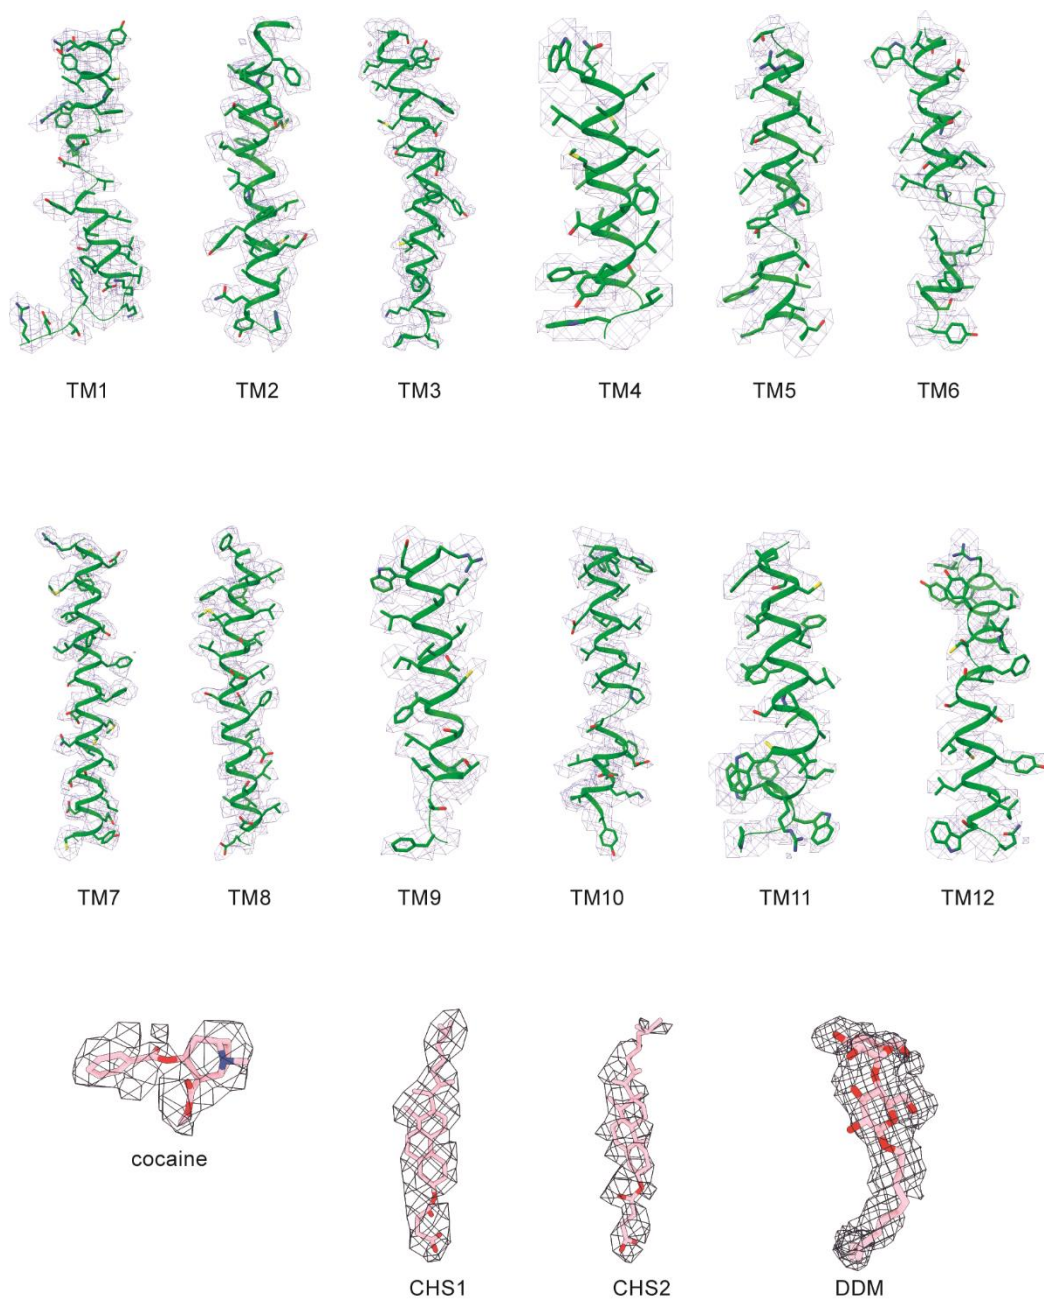

**Figure S4. Local resolution maps, overall plotted resolutions, and global map-model agreements. a** (+)-methamphetamine-pSERT Fab complex map is colored by local resolution. **b** Fourier shell correlation (FSC) curves for (+)-methamphetamine-pSERT Fab complex. **c** Local-resolution distribution of the cocaine-pSERT Fab map. **d** Map-map and map-model FSC curves for cocaine-pSERT Fab complex.

**Figure S5. Representative densities of (+)-methamphetamine-pSERT Fab complex.** Representative densities for transmembrane helices, (+)-methamphetamine cholesteryl hemisuccinate (CHS), and dodecylmaltoside (DDM).

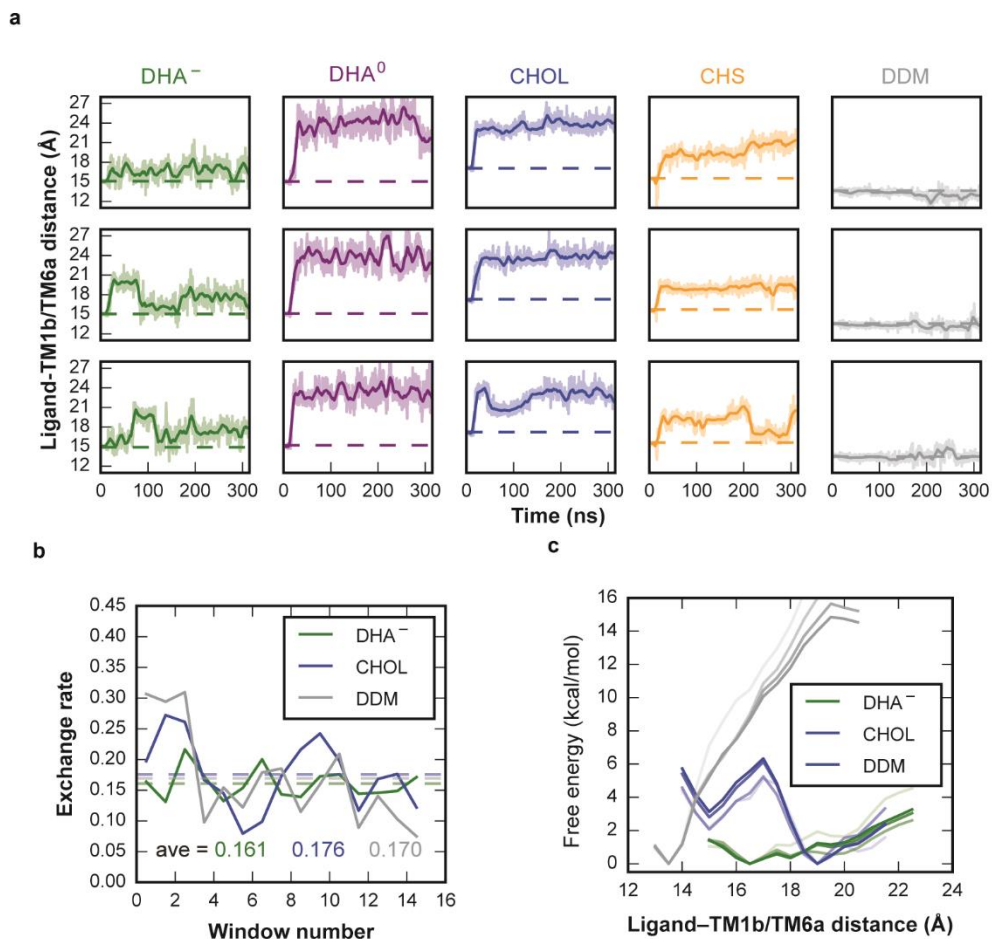

**Figure S6. Representative densities of cocaine-pSERT Fab complex.** Density fitting of transmembrane helices, cocaine, CHS, and DDM.

**Figure S7. The cryo-EM density maps of ligand-bound pSERT Fab complex and comparison of ligand binding in the central sites of SERT with dDAT.** **a** and **b** The cryo-EM density maps of (+)-methamphetamine-pSERT (a) and cocaine-pSERT (b) complex. **c** Superposition of the binding pockets of the (+)-methamphetamine-dDAT structure (PDB code: 4XP6) in grey with binding pockets of (+)-methamphetamine-pSERT (orange). Residues interacting with (+)-methamphetamine in dDAT have been indicated. **d** The superimposed pSERT-(+)-methamphetamine and hSERT-5-HT (outward-facing, PDB code: 7LIA). **e** Superposition of the central binding pocket of cocaine-dDAT structure (PDB code: 4XP4, grey), with central binding site of cocaine-pSERT (pink). Residues interacting with cocaine in dDAT have been indicated. **f** Structural comparison of pSERT-cocaine and hSERT-5-HT (outward-facing, PDB code: 7LIA). **g-h** Occupancy of the allosteric site by vilazodone (g), citalopram (h), and serotonin (i).

**Figure S8. Stability of lipids in the allosteric site monitored by root-mean-square deviation (RMSD) and convergence of BEUS simulations. a** Time series of ligand-TM1b/TM6a distance of the ligands at the allosteric site. Data for DHA<sup>-</sup>, DHA<sup>0</sup>, CHOL, CHS, and DDM are plotted in green, purple, blue, orange, and gray, respectively, and are shown for the three independent simulations in each case. The ligand-TM1b/TM6a distance is measured as the center-of-mass distance between heavy atoms in the ligand and C $\alpha$  atoms from TM1b and TM6a (residues 145-148 and 361-364). Dashed lines indicate the initial distances of each molecule. Plots are smoothed using a sliding window of 1 ns. **b** Exchange rates between neighboring windows monitored during the 60-ns BEUS simulations. **c** Convergence of the free energy profiles along the increase in time (10, 30, 50, and 60 ns, indicated by increasing opacities) of the simulations.

**Table S1. Supplementary Table 1 Cryo-EM data collection, refinement and validation statistics**
