

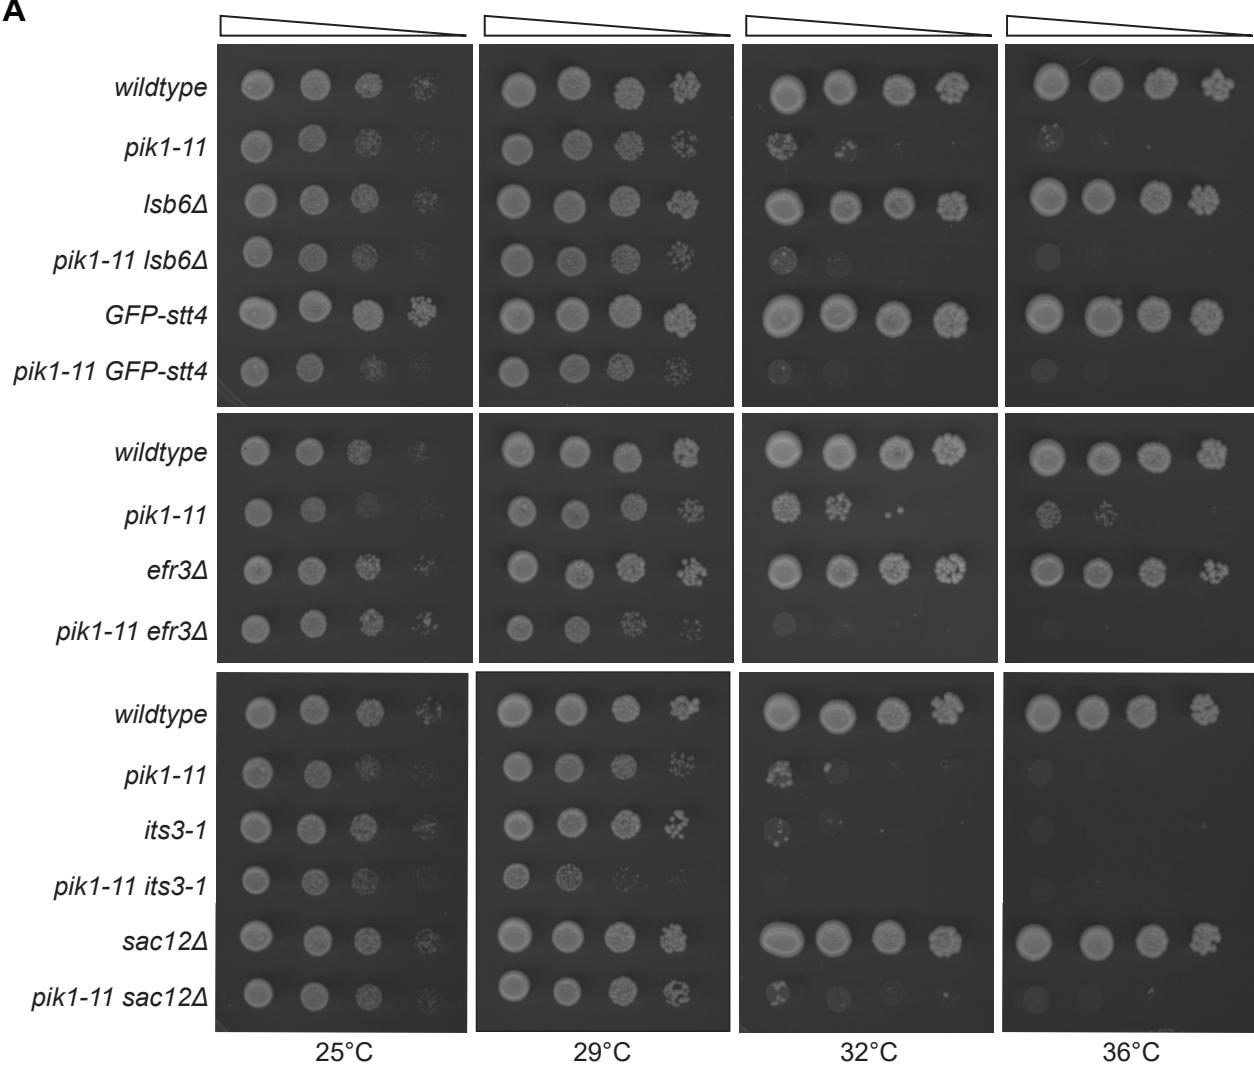

Fig. S1. *lsb6Δ* cells do not have reduced PI(4,5)P₂. A) Quantification of septum placement from DIC images of the indicated strains at the indicated temperatures. *wildtype* 25°C vs *pik1-11* 25°C, $P = 0.558$; *wildtype* 36°C vs *pik1-11* 36°C, $P = 0.106$. One-way ANOVA. Data is from two biological replicates and $n \geq 79$ for each. B) Live-cell images of GFP-2xPH_{PLC} in wildtype and *lsb6Δ* cells. Cells were grown at 25°C in YE. C, E) Line scans of fluorescence intensity drawn across the short axis of 10 cells for each indicated strain at the indicated temperature. Solid lines represent the mean and dotted lines are the individual line scans. Data is from two biological replicates. For C, *wildtype* vs. *lsb6Δ* at first peak, .93 μm distance, $P = 0.83$. For E, *wildtype* vs. *pik1-11* at first peak, 1.22 μm distance, $P < 0.0001$. **** $P \leq .0001$, Student's *t*-test. D) Live-cell images of Syj1-mNG, Inp53-mNG or GFP-Stt4 in wildtype and *pik1-11* cells. Cells were grown at 25°C and shifted to 36°C for 3 hours and imaged at both time points. Scale bars, 5 μm.

A

B

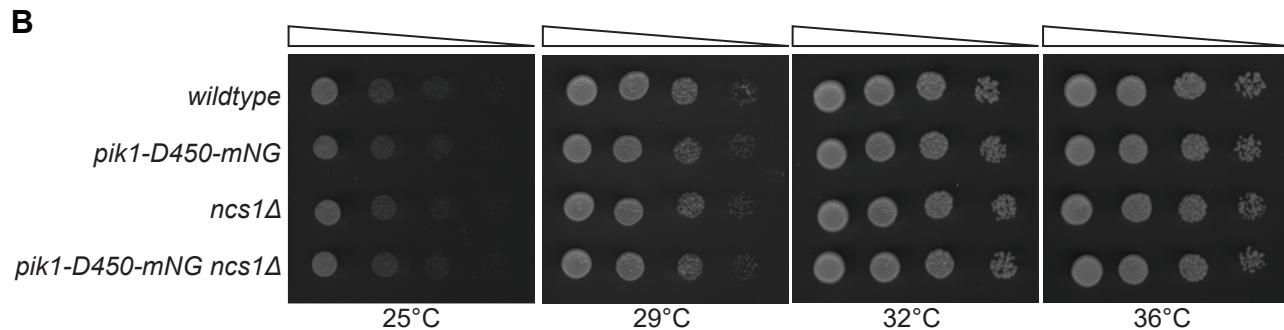

Fig. S2. Genetic analysis of *pik1-11*. A-B) 10-fold serial dilutions of the indicated strains grown at the indicated temperatures on YE agar for 3-4 days.

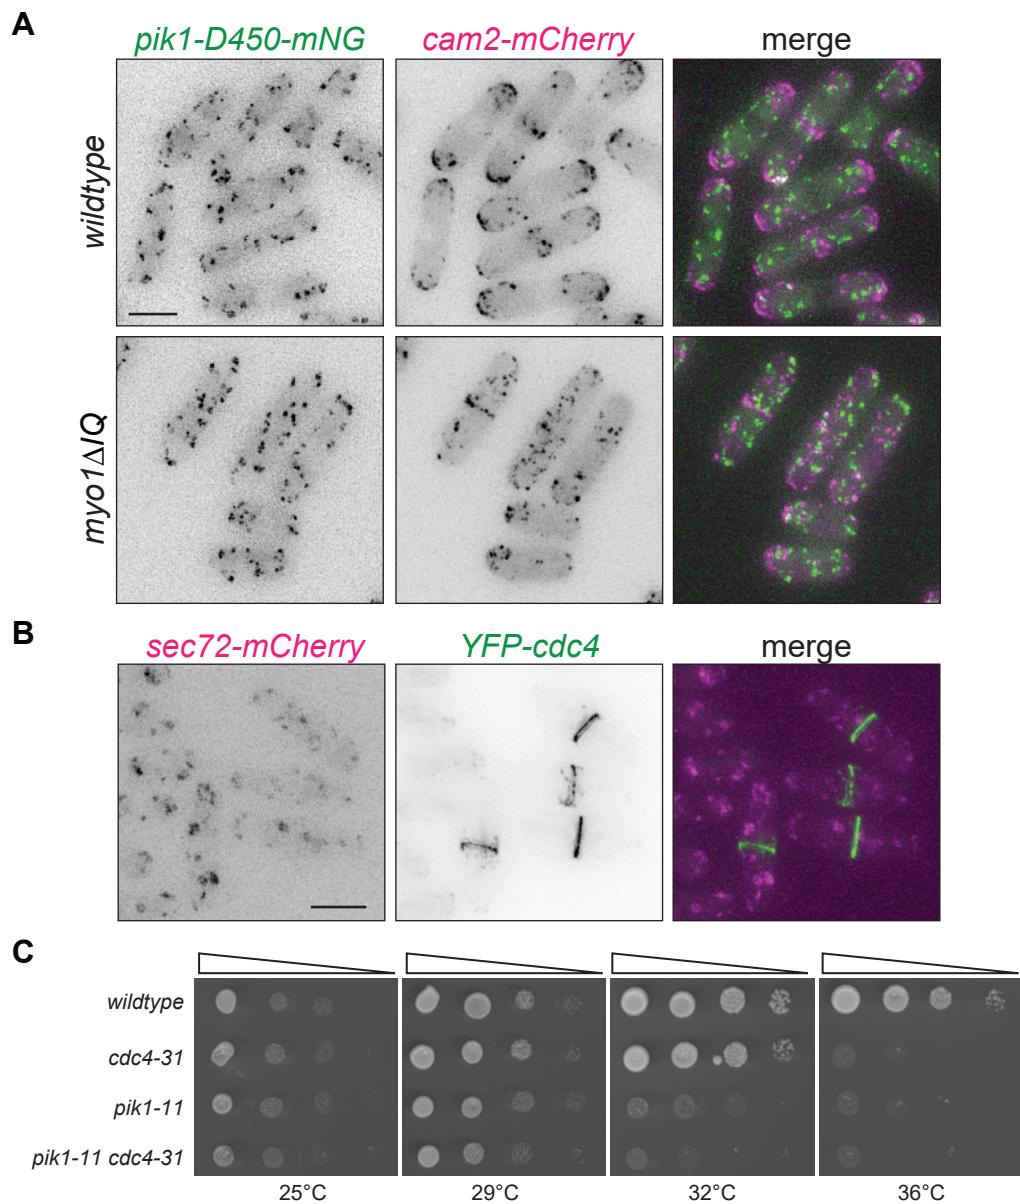

Fig. S3. Cam2 and Cdc4 do not colocalize with Pik1. A-B) Live-cell imaging of the indicated strains. Scale bars, 5 μ m. C) 10-fold serial dilutions of the indicated strains grown at the indicated temperatures on YE agar for 3-4 days.
