

Model	Training Method	Lesionwise Sensitivity	p^{Default}	p^{Method}	Lesionwise PPV	p^{Default}	p^{Method}
Default		0.30±0.04			0.93±0.04		
10	FT	0.52±0.02	<0.001*	0.252	0.68±0.02	<0.001*	<0.001*
	DN	0.49±0.01	<0.001*		0.35±0.02	<0.001*	
20	FT	0.55±0.02	<0.001*	0.002*	0.70±0.03	<0.001*	<0.001*
	DN	0.50±0.02	<0.001*		0.51±0.03	<0.001*	
30	FT	0.58±0.02	<0.001*	0.028	0.72±0.02	<0.001*	<0.001*
	DN	0.54±0.02	<0.001*		0.55±0.02	<0.001*	
40	FT	0.61±0.02	<0.001*	0.017	0.70±0.02	<0.001*	<0.001*
	DN	0.57±0.02	<0.001*		0.58±0.02	<0.001*	
50	FT	0.61±0.02	<0.001*	0.059	0.68±0.03	<0.001*	<0.001*
	DN	0.58±0.01	<0.001*		0.59±0.02	<0.001*	

Supplementary Table 1: Single timepoint FLAIR segmentation model performance with alternate shallow U-Net architecture. All sensitivity and PPV values are displayed as mean ± standard error. FT = fine-tuned, DN = de-novo, PPV = positive predictive value, $p^{\text{Default}} = p$ value from comparison with the default model, $p^{\text{Method}} = p$ value from comparison between fine-tuned and de-novo training methods with the same training dataset size. * indicates statistical significance ($p<0.05$ after accounting for Bonferroni correction).
