Supplementary Figures

Figure S1. The dual Sirt2/HDAC6 inhibitor **33** also shows an inhibition of Sirt2-mediated demyristoylation in a biochemical activity assay,[1] which is based on the conversion of a myristoylated peptide substrate (triplicate measurement, see Experimental Section for experimental details). The Sirt2 selective inhibitor **5**,[2] which was previously shown to inhibit Sirt2-mediated demyristoylation,[3] was used as a control.

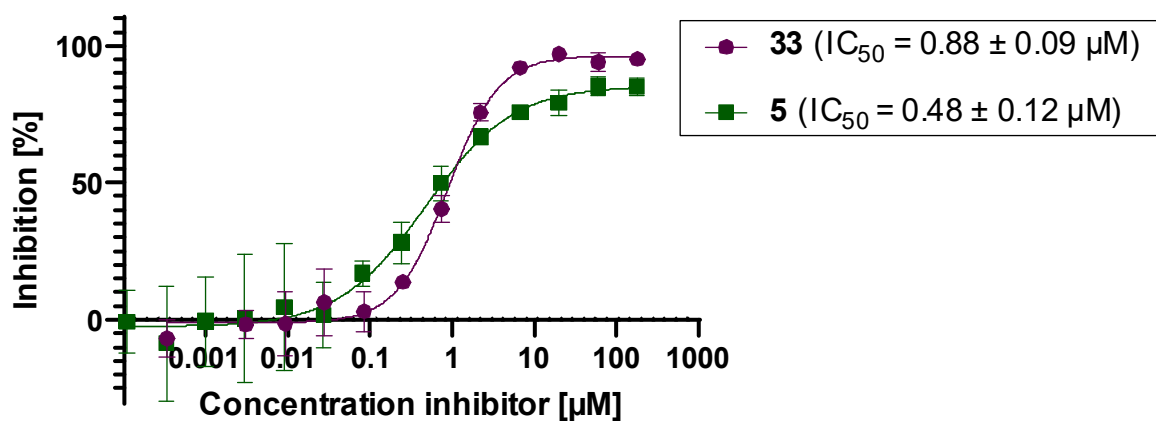

Figure S2. Results of the MD simulation of the Sirt2-5 crystal structure (PDB ID: 8OWZ) for two repeated MD runs (100 ns). a) RMSD plot of protein heavy atoms. b) RMSD plot of ligand heavy atoms. RMSD plot of MD 1 is colored red, for MD run 2 it is colored cyan.

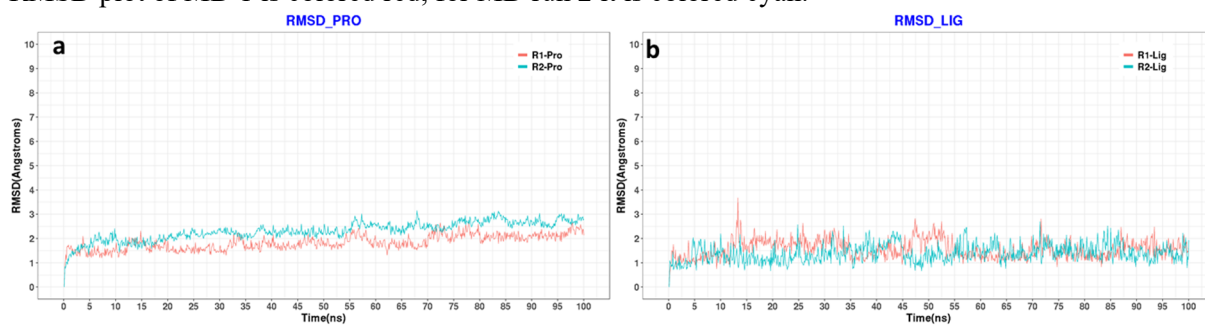

Figure S3. Results of the MD simulation of the HDAC6-57 crystal structure (PDB ID 8G20) for two repeated MD runs (100 ns). a) RMSD plot of protein heavy atoms. b) RMSD plot of ligand heavy atoms. c) RMSD plot of the zinc ion. d) Distance plot of the coordination of the hydroxamate oxygens O1 (NO⁻) and O2 (CO) to the zinc ion. RMSD plot of MD 1 is colored red, for MD run 2 it is colored cyan.

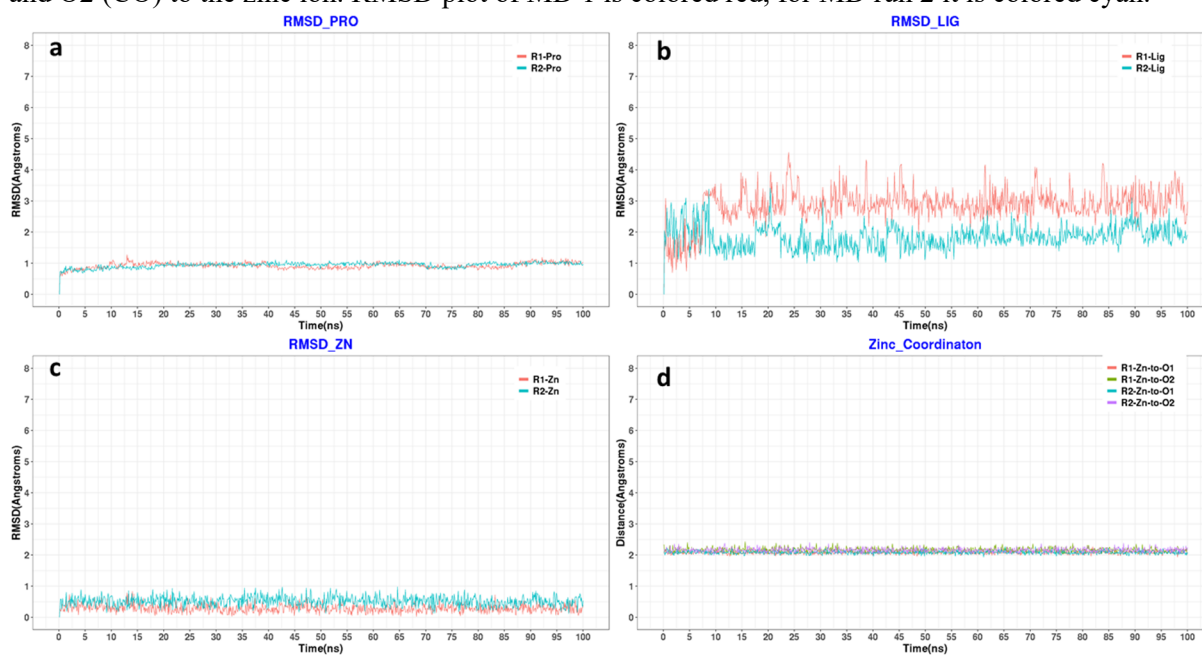

Figure S4. Results of the MD simulation of the Sirt2-33 docking complex for two repeated MD runs (100 ns). a) RMSD plot of protein heavy atoms. b) RMSD plot of ligand heavy atoms. RMSD plot of MD 1 is colored red, for MD run 2 it is colored cyan.

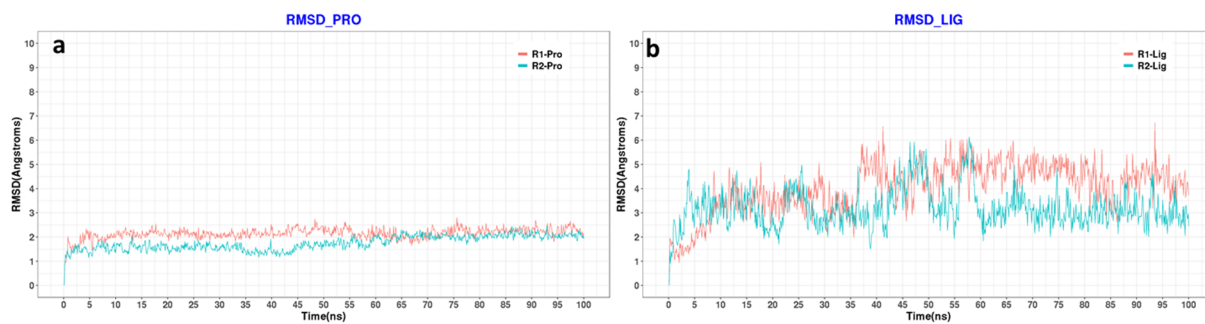

Figure S5. Results of the MD simulation of the Sirt2-32 docking complex for two repeated MD runs (100 ns). a) RMSD plot of protein heavy atoms. b) RMSD plot of ligand heavy atoms. RMSD plot of MD 1 is colored red, for MD run 2 it is colored cyan.

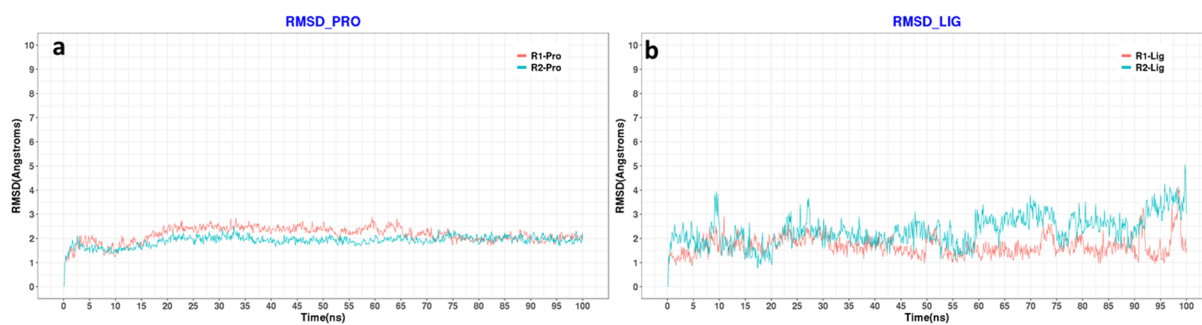

Figure S6. Shown are selected frames of MD simulations of Sirt2 ligand complexes at 0 ns (lime carbon atoms), 50 ns (magenta carbon atoms) and 100 ns (yellow carbon atoms). Ligands are shown as sticks, proteins are shown as white cartoons for clarity. a) Frames of the MD run 1 of Sirt2-5 crystal structure (PDB ID: 8OWZ). b) Frames of the MD run 2 of Sirt2-5 crystal structure (PDB ID: 8OWZ). c) Frames of the MD run 1 of Sirt2-33 docking complex. d) Frames of the MD run 2 of Sirt2-33 docking complex. e) Frames of the MD run 1 of Sirt2-32 docking complex. f) Frames of the MD run 2 of Sirt2-32 docking complex.

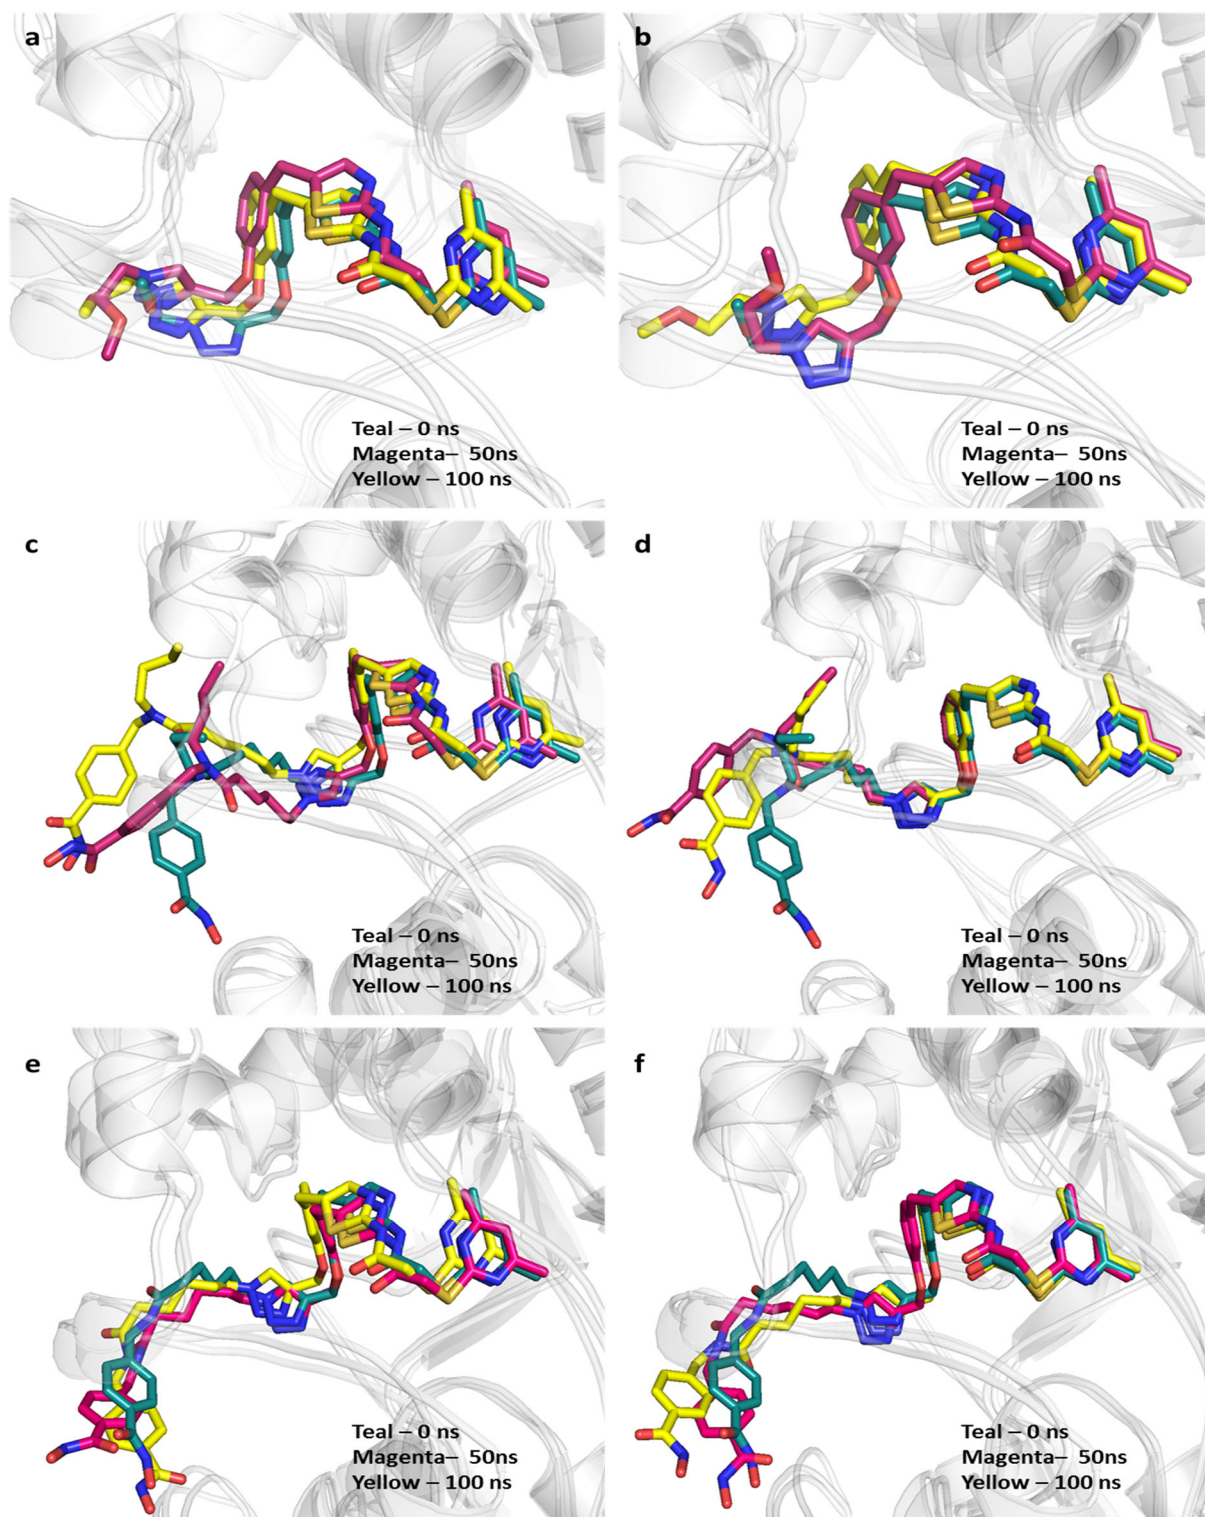

Figure S7. Results of the MD simulation of the HDAC6-33 docking complex for two repeated MD runs (100 ns). a) RMSD plot of protein heavy atoms. b) RMSD plot of ligand heavy atoms. c) RMSD plot of the zinc ion. d) Distance plot of the coordination of the hydroxamate oxygens O1 (NO⁻) and O2 (CO) to the zinc ion. RMSD plot of MD 1 is colored red, for MD run 2 it is colored cyan.

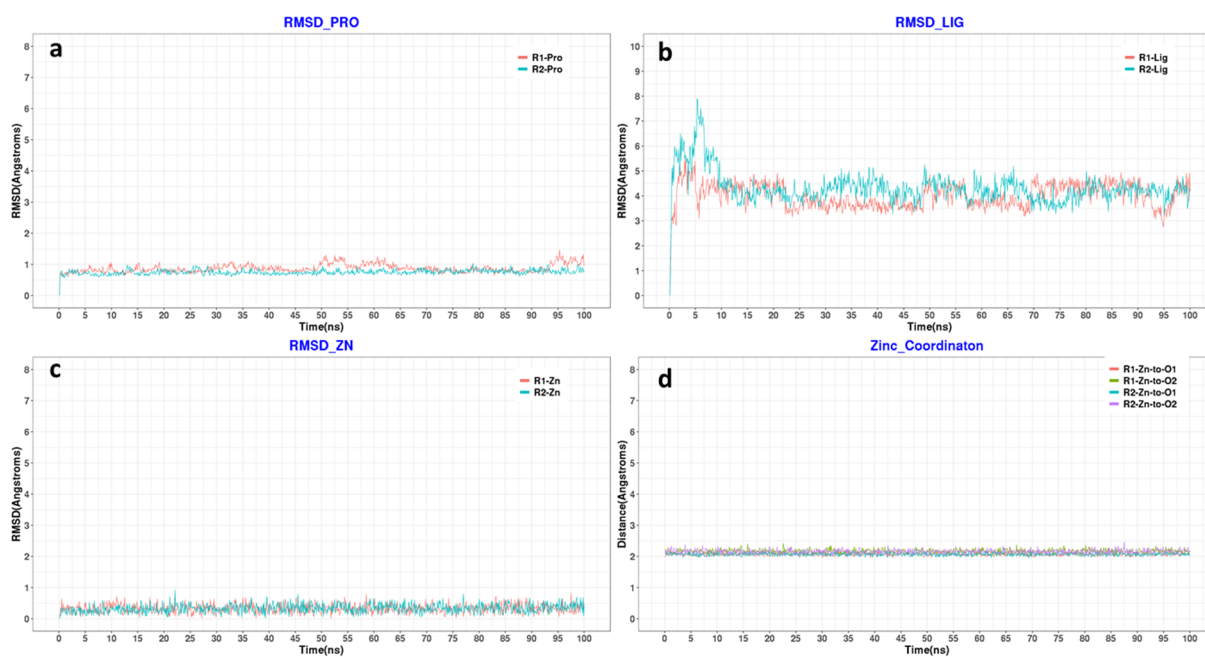

Figure S8. Results of the MD simulation of the HDAC6-32 docking complex for two repeated MD runs (100 ns). a) RMSD plot of protein heavy atoms. b) RMSD plot of ligand heavy atoms. c) RMSD plot of the zinc ion. d) Distance plot of the coordination of the hydroxamate oxygens O1 (NO⁻) and O2 (CO) to the zinc ion. RMSD plot of MD 1 is colored red, for MD run 2 it is colored cyan.

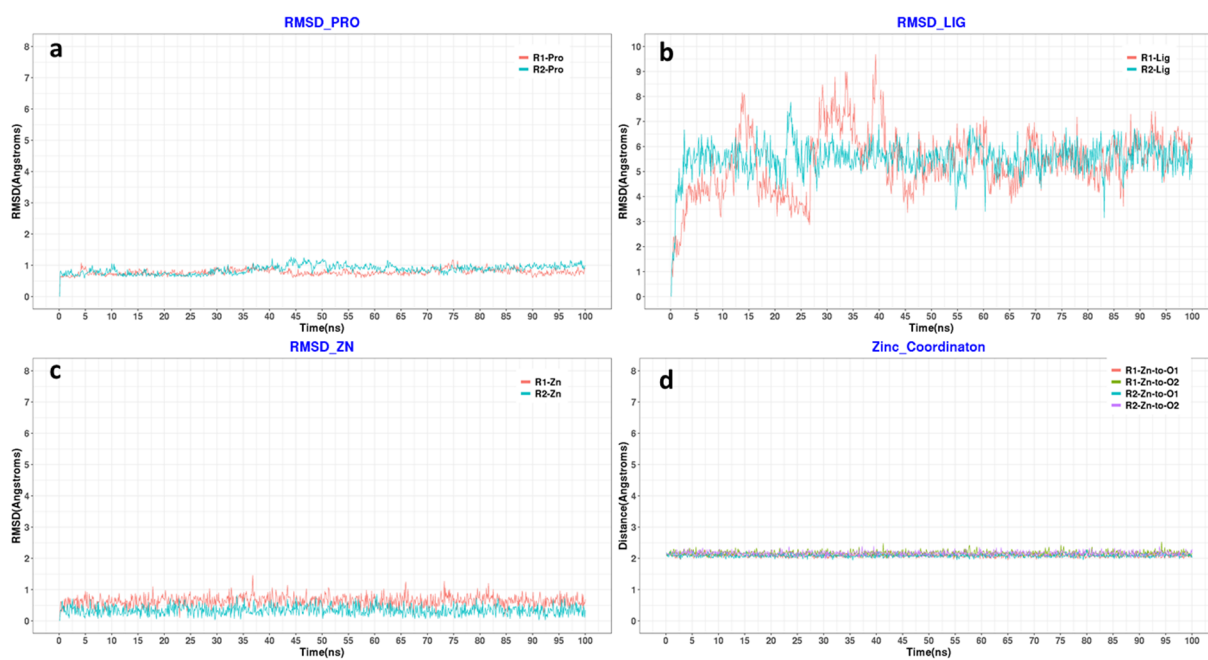

Figure S9. Shown are selected frames of the MD simulations of HDAC6-ligand complexes at 0 ns (lime carbon atoms), 50 ns (magenta carbon atoms) and 100 ns (yellow carbon atoms). Ligands are shown as sticks, proteins are shown as white cartoons for clarity and the zinc ions are shown as orange spheres. a) Frames of the MD run 1 of the HDAC6-57 crystal structure. b) Frames of the MD run 2 of the HDAC6-57 crystal structure. c) Frames of the MD run 1 of HDAC6-33 docking complex and d) Frames of the MD run 2 of HDAC6-33 docking complex. e) Frames of the MD run 1 of HDAC6-32 docking complex. f) Frames of the MD run 2 of HDAC6-32 docking complex.

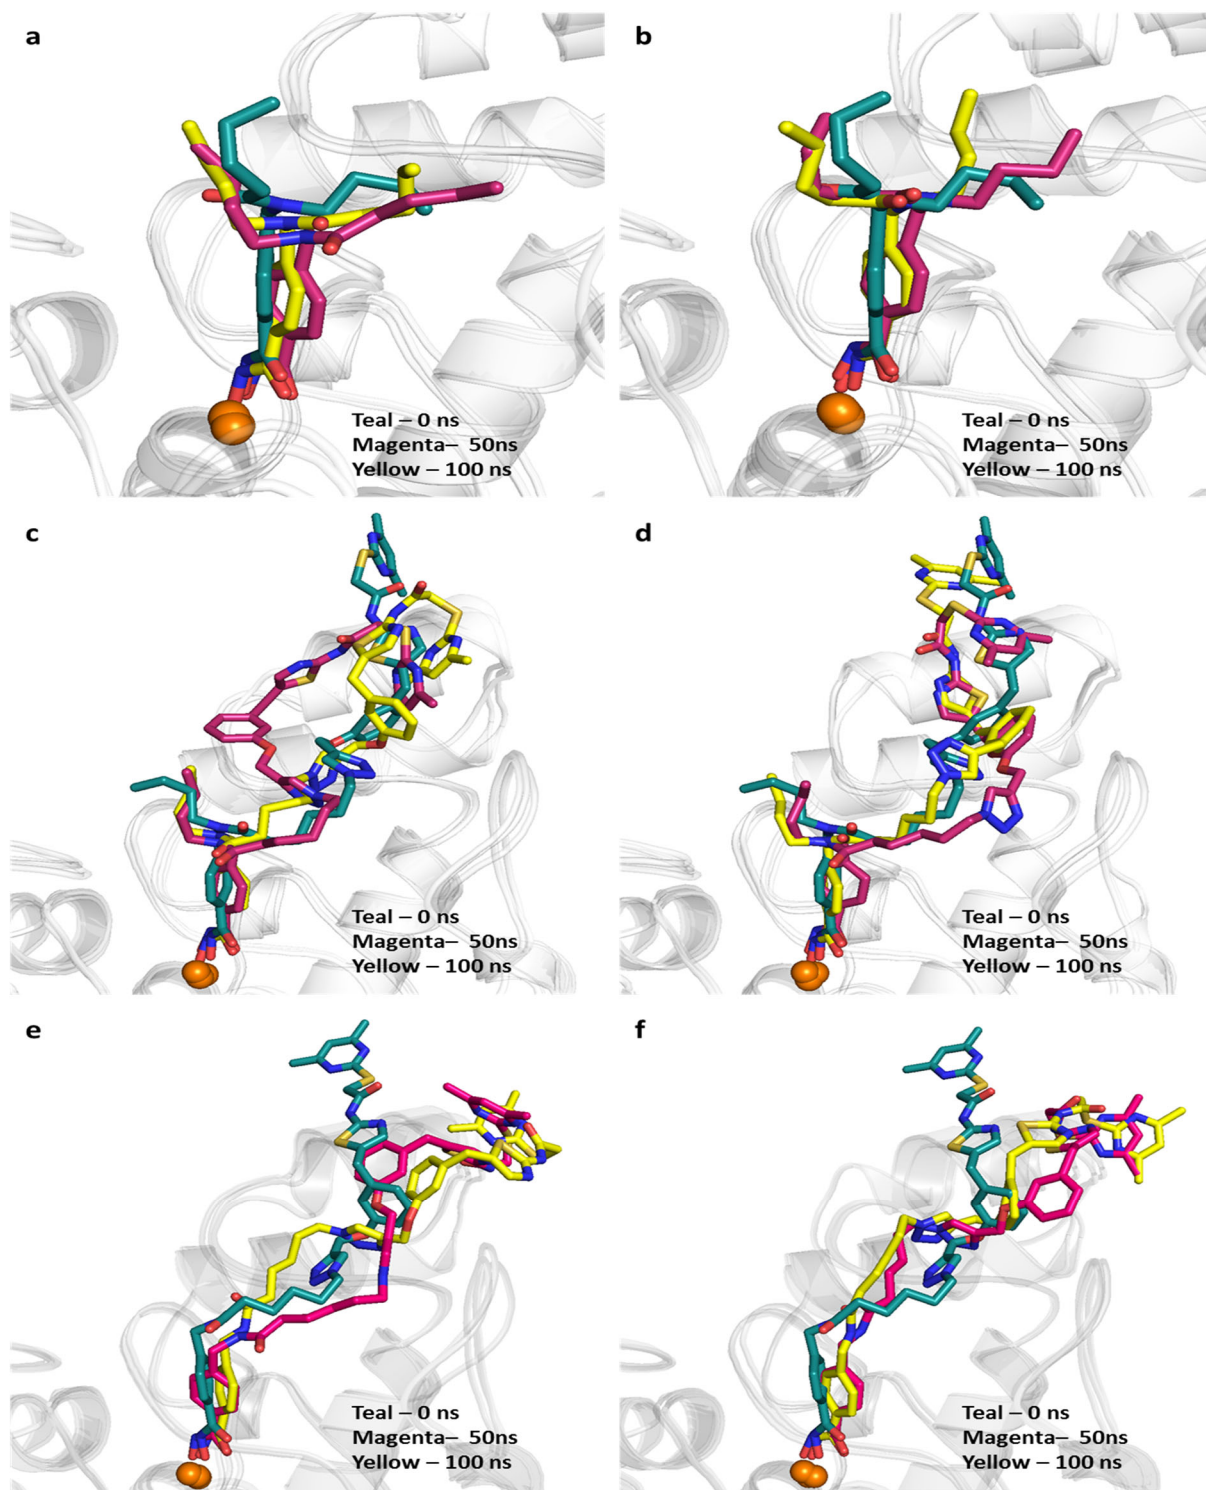

Figure S10. Chemical structures of molecular tools used to demonstrate cellular target engagement for the dual Sirt2/HDAC6 inhibitor **33**. A) Sirt2 selective fluorescent probe SirReal-TAMRA (**61**),[3, 4] which was used to demonstrate cellular Sirt2 target engagement for the dual Sirt2/HDAC6 inhibitor **33** *via* a cellular NanoBRET assay. B) HDAC6 selective PROTAC B4 (**62**),[5] which was used to demonstrate cellular HDAC6 target engagement for the dual Sirt2/HDAC6 inhibitor **33** *via* a degradation rescue experiment.

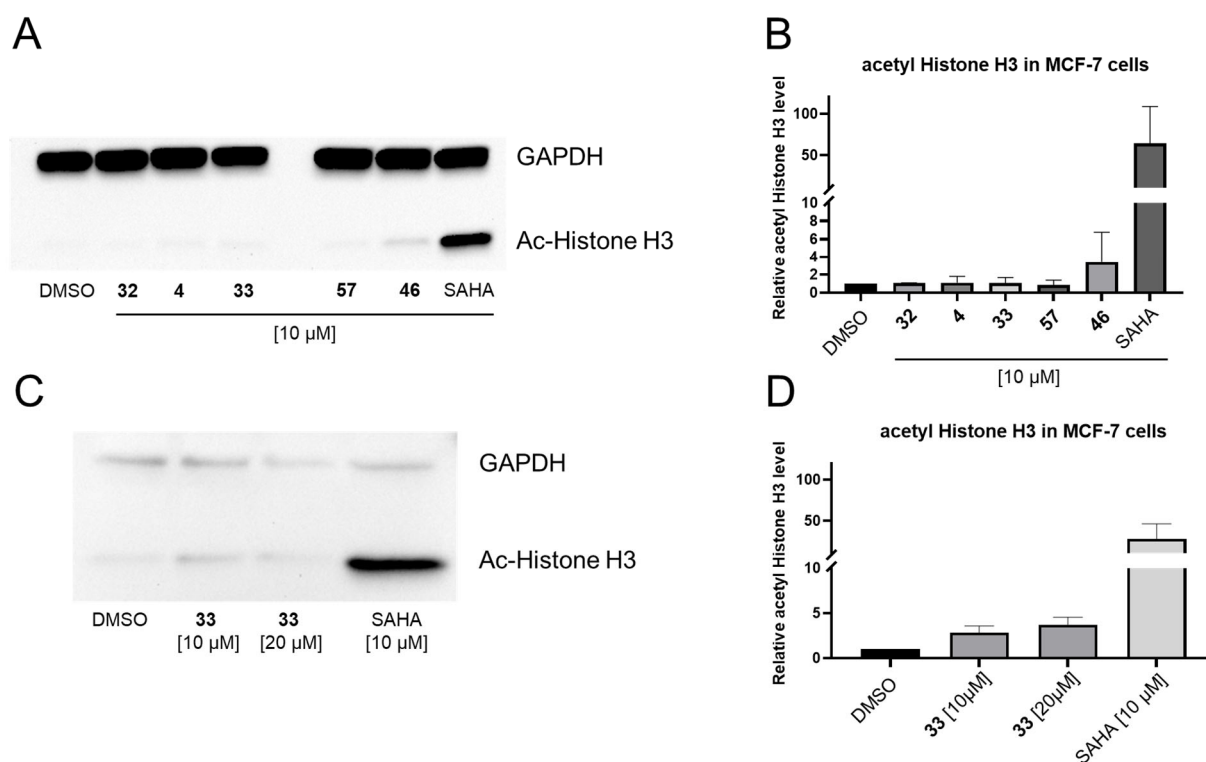

Figure S11. Dual Sirt2/HDAC6 inhibitors **32** and **33** evoke no significant off-target inhibition of class I HDACs at a cellular level, as shown by the investigation of histone H3 hyperacetylation, a marker for cellular inhibition of HDAC1-3. Tests were performed with MCF-7 breast cancer cells, a well-established cell line for the investigation of class I HDAC inhibition.[6-8] A) Representative western blot from whole cell lysates of MCF-7 cells after 24 h treatment with dual Sirt2/HDAC6 inhibitors **32** or **33**, unconjugated Sirt2 inhibitor **4**, unconjugated HDAC6 inhibitor **57**, and the Sirt2/HDAC inhibitor **46**. SAHA was used as a positive control and DMSO as a vehicle control. Compounds were tested at a concentration of 10 μ M. B) Western blot quantification (n = 3). C) Effects of **33** on histone H3 acetylation at compound concentrations of 10 μ M and 20 μ M. Representative western blot from whole cell lysates of MCF-7 breast cancer cells after 24 h treatment with the dual Sirt2/HDAC6 inhibitors **33**. D) Western blot quantification (n = 3).

Supplementary Tables

Table S1. Dual Sirt2/HDAC6 inhibitor **33** tested by means of biochemical *in vitro* deacylation assays (see Experimental Section for more experimental details).[9-11] IC₅₀ values [μ M, mean \pm SD] or percentual inhibition at a given concentration of the dual Sirt2/HDAC6 inhibitor. Nicotinamide (NA) and panobinostat (Pano) were used as reference compounds for sirtuin and Zn²⁺-dependent HDAC inhibition, respectively.

Ramachandran plot (%) ^h			
favored	97.26	97.2	96.9
allowed	2.74	2.8	3.1
outliers	0	0	0
PDB accession code	8OWZ	8G1Z	8G20

^a Values in parentheses refer to the highest-resolution shell of the data.

^b $R_{\text{merge}} = \sum |I_h - \langle I_h \rangle| / \sum \langle I_h \rangle$; I_h = intensity measure for reflection h ; $\langle I_h \rangle$ = average intensity for reflection h calculated from replicate data.

^c $R_{\text{pim}} = \sum (1/(n-1)^{1/2} |I_h - \langle I_h \rangle|) / \sum \langle I_h \rangle$; n = number of observations (redundancy).

^d $\text{CC}_{1/2} = \sigma_{\tau}^2 / (\sigma_{\tau}^2 + \sigma_{\epsilon}^2)$, where σ_{τ}^2 is the true measurement error variance and σ_{ϵ}^2 is the independent measurement error variance.

^e $R_{\text{work}} = \sum ||F_o| - |F_c|| / \sum |F_o|$ for reflections contained in the working set. $|F_o|$ and $|F_c|$ are the observed and calculated structure factor amplitudes, respectively.

^f $R_{\text{free}} = \sum ||F_o| - |F_c|| / \sum |F_o|$ for reflections contained in the test set held aside during refinement.

^g Per asymmetric unit.

^h Assessed by MolProbity.
