Supplemental Table

Table S1. Characteristics of groups with incomplete vs. complete 6-minute walk test distance data

Values are shown as absolute numbers (percentages and mean \pm SD or median with IQR). AF indicates atrial fibrillation; BMI, body mass index; eGFR, estimated glomerular filtration rate; IQR, interquartile range; KCCQ-OS, Kansas City Cardiomyopathy Questionnaire overall summary score; NTproBNP, N-terminal pro B-type natriuretic peptide; NYHA, New York Heart Association; SD, standard deviation; and 6MWT, 6-minute walk test.

Supplemental Figure

Figure S1. Responder analysis (using 20 m) of effects of dapagliflozin (Dapa) on 6-minute walk test (6MWT) distance.

A, Data are represented as proportion of patients experiencing 6MWT distance deterioration, no change, or improvement per treatment group. **B**, Likelihood of improvement ≥ 20 m vs deterioration ≤ 20 m on Dapa (vs placebo) after adjusting for baseline measurements including age, sex, race, history of diabetes, body mass index (BMI), left ventricular ejection fraction (LVEF), history, and type of atrial fibrillation (AF), Kansas City Cardiomyopathy Questionnaire (KCCQ), estimated glomerular filtration rate (eGFR), loop diuretic dose, New York Heart Association (NYHA) functional class, N-terminal pro B-type natriuretic peptide (NT-proBNP) and baseline 6MWT distance.
