

BMJ Open

BMJ Open is committed to open peer review. As part of this commitment we make the peer review history of every article we publish publicly available.

When an article is published we post the peer reviewers' comments and the authors' responses online. We also post the versions of the paper that were used during peer review. These are the versions that the peer review comments apply to.

The versions of the paper that follow are the versions that were submitted during the peer review process. They are not the versions of record or the final published versions. They should not be cited or distributed as the published version of this manuscript.

BMJ Open is an open access journal and the full, final, typeset and author-corrected version of record of the manuscript is available on our site with no access controls, subscription charges or pay-per-view fees (<http://bmjopen.bmj.com>).

If you have any questions on BMJ Open's open peer review process please email info.bmjopen@bmj.com

ABSTRACT

Introduction: The use of immune checkpoint inhibitors (ICIs) is rapidly expanding in cancer treatment. ICI has a unique safety profile, known as immune-related adverse events (irAEs). The safety profile of ICIs lacks patient experience and perspectives. This study primarily aims to obtain a database for descriptive research on the status of irAEs using the Patient-Reported Outcomes version of the Common Terminology Criteria (PRO-CTCAE) in patients with gastrointestinal cancer, lung cancer, and malignant pleural mesothelioma treated with regimens containing ICIs.

Methods and analysis: This is an ongoing, multicentre, observational study. Eligible patients must be aged at least 20 years and have been diagnosed with lung cancer, malignant pleural mesothelioma, or gastrointestinal cancer and plan to use ICIs. Participants will install the ePRO application and report adverse events via ePRO using PRO-CTCAE once weekly for up to 48 weeks. In addition, a registry will be established using background information obtained from medical records. The sample size is determined by one-year projection without using statistical methods. Statistical analyses will include point estimates and 95% confidence intervals for the incidence of each adverse event by cancer type and regimen at each time point.

Ethics and dissemination: This research will be conducted per the Declaration of Helsinki, the Ethical Guidelines for Life Science and Medical Research Involving Human Subjects issued by the Ministry of Education, Culture, Sports, Science and Technology and the Ministry of Health, Labor and Welfare, and the revised Personal Information Protection Law. The study protocol was approved by the Ethics Committee (approval ID T2021-0180) of Tokyo Medical University Hospital on October 15, 2021.

1
2
3 **Registration details:** The study began enrolling patients in December 2021. The target
4
5 enrolment is 260; as of October 2022, 141 have been enrolled, and the enrolment is scheduled
6
7 to end on June 30, 2023.

17 **STRENGTHS AND LIMITATIONS OF THE STUDY**

- 19 • Insufficient information on symptom-related adverse events of regimens containing
20 immune checkpoint inhibitors can be clarified.
21
22
- 23 • Multiple insights into adverse event monitoring using PRO-CTCAE via ePRO, which
24 can collect adverse events in real-time without patient visits in Japanese clinical
25 practice settings, can be provided.
26
27
- 28 • The selected items of PRO-CTCAE in this study were determined by reviewing
29 previous literature and Japanese drug package inserts and discussed by the board-
30 certified oncology pharmacy specialist and through patient public involvement.
31
32
- 33 • A limitation of this study is that patients cannot be evaluated for PRO-CTCAE items
34 not selected by the investigator at the time of planning. Not all patient-reported safety
35 profiles are available.

INTRODUCTION

In 2017, the number of malignant tumour (cancer) patients and deaths worldwide were 24.5 million and 9.6 million, respectively.[1] The number of cancer patients in Japan was 775,601 in 2009.[2] Cancer treatment centres on surgery, drug therapy, and radiation therapy. Recently, immunotherapy has attracted attention, and insurance coverage for immune checkpoint inhibitors (ICIs) is rapidly expanding. The following cancer types are currently covered by insurance in Japan: non-small cell lung cancer, small cell lung cancer, malignant pleural mesothelioma, oesophageal cancer, gastric cancer, colorectal cancer, hepatocellular cancer, head and neck cancer, breast cancer, cervical cancer, uterine cancer, urothelial cancer, renal cancer, melanoma, solid tumours with high microsatellite instability-high (MSI-H), tumour mutational burden-high (TMB-H), and Hodgkin's lymphoma. Among the cancers for which ICI is indicated, in which respiratory and gastrointestinal cancers are the most common, 103,715 cases were lung cancer, 122,632 gastric cancer, 116,342 colorectal cancer, 48,003 liver cancer, and 20,787 oesophagus cancer in 2009 in Japan.[2]

Adverse events in ICI treatment differ from those of conventional cytotoxic anticancer and molecular-targeted drugs in that they may present with specific autoimmune-like immune-related adverse events (irAEs).[3] Although irAEs are relatively common in the skin, gastrointestinal tract, liver, lung, and endocrine organs, they can theoretically occur anywhere in the body.[4] IrAEs can occur at any time after the start and even after the completion of ICI administration.[5] Ipilimumab is reported to cause more skin irAEs after 2–3 weeks, gastrointestinal and hepatic after 6–7 weeks, and endocrinal after 9 weeks.[6] In contrast, nivolumab is reported to cause more skin irAEs after 5 weeks; gastrointestinal, hepatic, and pulmonary after 7–8 weeks, endocrinal after 10 weeks, and renal after 15 weeks.[7] However, most irAEs were reported to occur within 6 months of prolonged treatment with nivolumab and were not cumulative.[8] Although careful monitoring is

1
2
3 recommended after ICI administration, there is no settled opinion on the monitoring period.
4
5 IrAEs should be monitored by a physician or a physician's assistant. The response varies by
6
7 organ, but as a general rule, the administration should be postponed or interrupted when \geq
8
9 Grade 2 is reached; systemic corticosteroids should be considered. After starting treatment
10
11 with steroids, it is recommended that they be tapered off over several weeks while checking
12
13 for irAE recurrence and subsequently discontinued or adjusted to a low-maintenance dose.[9,
14
15
16
17 10]

18
19 Patient-reported outcome (PRO) is defined as ‘an evaluation method in which patients
20
21 judge their symptoms and quality of life; the results are obtained without any intervention
22
23 from doctors or other parties’ by the Food and Drug Administration.[11] In recent years,
24
25 adverse events assessment using PROs has gained prominence in oncology. Basch et al.[12]
26
27 reported that adverse event assessments in providers and patients are inconsistent, with a
28
29 tendency for providers to underestimate them. This problem led to the development of a PRO
30
31 version of the Common Terminology Criteria for Adverse Events (CTCAE), PRO-CTCAE,
32
33 in 2008. In a randomised controlled trial, a comparison of the pro-active approach with PRO-
34
35 CTCAE using electronic PRO (ePRO) for adverse events with a conventional adverse event
36
37 evaluation showed a significant difference in health-related quality of life and overall
38
39 survival.[13] This study has attracted attention as a trial that will change clinical practice. The
40
41 results have led to the use of PRO-CTCAE in many countries, including Japan.
42
43
44
45
46

47 Early detection and monitoring of irAEs are important, and PROs are useful.[14]
48
49 However, Tolstrup et al.[15] noted that the procedure for selecting PRO-CTCAE items in
50
51 patients receiving immunotherapy is not well established. They reported a method for
52
53 selecting PRO-CTCAE questions for patients with malignant melanoma receiving
54
55 immunotherapy. Studies of PRO-CTCAE in ICI-using patients have been reported in
56
57 malignant melanoma and non-small cell lung cancer.[16, 17] Based on these studies, the
58
59
60

1
2
3 PRO-CTCAE is used as a questionnaire to evaluate irAE; however, few studies on irAE and
4
5 PRO-CTCAE are available.
6

7
8 The present study, named RESPECT (REGistry Study of immune-related adverse
9
10 events using electronic Patient-reported outcome in patiEnts with cancer receiving immune
11
12 CheckpointT inhibitors) study, aims to obtain a database for descriptive research on the status
13
14 of irAEs, focusing on symptom-related adverse events in patients with cancer receiving
15
16 regimens that include ICIs. In addition, it aims to determine the rate of symptom-related
17
18 adverse events at each time point in the setting in which ePRO adverse event monitoring is
19
20 performed.
21
22

23 24 25 26 **METHODS AND ANALYSIS**

27 28 **Study design**

29
30 This is an ongoing, multicentre, longitudinal, observational study. An observational study
31
32 design is used to track the mode and course of irAEs, focusing on symptom-related adverse
33
34 events. Participants will install the ePRO application and report adverse events weekly via
35
36 ePRO using PRO-CTCAE. In addition, a registry will be established using background
37
38 information obtained from medical records; ancillary studies will be conducted on the
39
40 proportion of adverse event reporting by ePRO and those associated with ICIs.
41
42
43
44
45

46 47 **Patient and public involvement**

48
49 The following two patient groups were asked to cooperate in participation: Non-Profit
50
51 Organization Lung Cancer Patients Association One Step and General Incorporated
52
53 Association Esophageal Cancer Survivor's Sharing. The research plan will include the advice
54
55 given on PRO-CTCAE item selection, number of questions, and survey frequency. Advice
56
57 will also be obtained at each stage of the process leading up to the publication of the results.
58
59
60

Study setting, participants, and recruitment

Recruitment is being performed at nine hospitals in Japan. The inclusion criterion is the diagnosis of lung cancer, malignant pleural mesothelioma, or gastrointestinal cancer in patients who plan to use an ICI and give their written consent to participate in the study, over 20 years old, and with Eastern Collaborative Oncology Group Performance Status (ECOG PS) of 0–3. Patients who do not have an ePRO-eligible device, have a severe psychiatric illness or cognitive dysfunction that affects filling out the survey form, or those with a native language that is not Japanese are excluded. The study pharmacist will invite eligible patients to participate in the study at each site. After starting treatment, participants will complete weekly ePROs, an adverse events monitoring questionnaires at week 12, and treatment satisfaction questionnaires at weeks 24 and 48. Observation shall be discontinued in the following cases: (1) if the participant requests to discontinue the adverse event evaluation using ePRO, (2) when follow-up is no longer possible due to hospital transfer, (3) death during follow-up, (4) if consent is withdrawn, and (5) loss to follow-up.

Outcome measures

Supplementary Table S1 shows the study schedule. We will use the PRO-CTCAE and the CTCAE v5.0 to assess adverse events. In addition, we will use Cancer Therapy Satisfaction Questionnaire (CTSQ) to assess treatment satisfaction.

Adverse events

Adverse events will be assessed using CTCAE v5.0, translated by the Japan Clinical Oncology Group as Clinician-Reported Outcome (ClinRO), and PRO-CTCAE as PRO. Since its development as a common toxicity criterion in 1984, the CTCAE has been the gold

1
2
3 standard as ClinRO for adverse event assessment and is widely used in clinical research,
4 particularly in the field of oncology. The CTCAE v5.0 will be recorded from the medical
5 record each time they are assessed; items corresponding to PRO-CTCAE will be mandatory.
6
7
8
9
10 Meanwhile, the PRO-CTCAE, developed by the National Cancer Institute in 2008, consists
11 of 80 items from the CTCAE version 4, extracting 78 symptoms that can be subjectively
12 assessed by the patients and has been reworded to make them easier for patients to answer.
13
14
15 Each item is assessed using one or more attributes, including presence/absence, frequency,
16 severity, and/or interference with usual or daily activities. The original version has been
17 evaluated for validity and reliability by Dueck et al.[18] The Japanese version of PRO-
18 CTCAE has been validated for linguistic and psychometric validity by Miyaji et al.[19] and
19 Kawaguchi et al.[20], respectively.
20
21
22
23
24
25
26
27
28
29

30 **Treatment satisfaction**

31
32 The CTSQ is a 16-item questionnaire developed by Pfizer to measure treatment satisfaction
33 specifically with cancer treatment. It has three subscales, 'Expectations of Treatment',
34 'Feelings about Side Effects', and 'Satisfaction with Therapy', which are scored from 0 to
35 100. Higher scores indicate higher satisfaction. This questionnaire has been validated by
36
37
38
39
40
41
42
43
44
45

47
48
49
50
51
52
53
54
55
56
57
58
59
60

56 **Sample size determination**

57
58 The sample size was not calculated based on a statistical perspective. Considering the annual
59 number of patients treated with ICIs at each site and the proportion of smartphone or tablet
60 ownership for ePRO, and obtaining consent, a target enrolment number of at least 260
patients per year was set.

Data collection and timeline

The researcher will perform web registration for the participants' data using the electronic data capture (EDC) system, Viedoc 4 (Viedoc Technologies, Sweden). Participants will respond to the PROs using 3H P-Guardian (3H Clinical Trial Inc, Japan), an ePRO application, on their own device (smartphone or tablet) at 49 time points: at baseline and weeks 1–48 after initiating ICI therapy. The investigator will explain the details of this research to the patient. After obtaining patient consent, data on psychosocial background and PRO-CTCAE will be collected from the participant's electronic device. Data on demographics, medical history, and CTCAE v5.0- JCOG scores will be collected and entered into EDC and linked to baseline PRO data. An investigator will check ePRO data within the scope of daily practice and contact participants depending on the input status. They will also be asked to record treatment satisfaction at weeks 24 and 48. The investigator will then assess each participant's adverse events using CTCAE on the day of the presentation or during hospitalisation. Adverse event assessment using CTCAE and PRO-CTCAE will continue after treatment with ICI is discontinued. The study timeline is shown in Supplementary Table S1.

Data monitoring

The data centre is located at the Tohoku Graduate School of Medicine (Miyagi Prefecture, Japan). To protect participants' privacy, no personally identifiable information will be entered into the EDC. Data management and central data monitoring will be performed using the EDC. Establishment of a data monitoring committee and auditing is not planned for this study. Following the data entry of this study, the fixed data will be exported and deleted from the EDC and will be stored in the research office in electronic media for at least 10 years after the principal publication.

Harm

This is a non-interventional, non-invasive, observational study. Therefore, the burden on the participants is minimal. Participant contributions for time spent filling out questionnaires, installing applications, and communication costs for data transmission will be explained in writing and verbally in the consent explanation. Consent will be fully explained before enrolment, and participants can withdraw even while the questionnaire is being filled out.

Statistical analysis

The primary purpose is to obtain a database for descriptive research on the actual status of irAEs, focusing on symptom-related adverse events in patients with cancer receiving regimens that include ICIs. Furthermore, we aim to determine the incidence of symptom-related adverse events at each time point in an environment where ePRO-based adverse event monitoring is conducted in daily practice. Point estimates and 95% confidence intervals of the incidence of each adverse event at each time point by cancer type and regimen will be estimated. The treatment of missing values will not be specified in advance. In addition, we will examine the association between symptom-related adverse events and the extent of pharmacist actions and summarise the ePRO completion rate using descriptive statistics as the reality of pharmacist actions for PRO-CTCAEs.

ETHICS AND DISSEMINATION

Research ethical approval

This research will be conducted per the Declaration of Helsinki, the Ethical Guidelines for Life Science and Medical Research Involving Human Subjects issued by the Ministry of Education, Culture, Sports, Science and Technology and the Ministry of Health, Labor and

1
2
3 Welfare, and the revised Personal Information Protection Law. The protocol was approved by
4 the Ethics Committee of Tokyo Medical University Hospital (approval ID T2021-0180) on
5
6 October 15, 2021. The version of the protocol became 1.1 in March 2022. The protocol has
7
8 been reviewed by the Institutional Review Boards of the following research centres. Juntendo
9
10 University Nerima Hospital, JR Tokyo General Hospital, Nippon Medical School Hospital,
11
12 Kyorin University Hospital, Teine Keijinkai Hospital, Nihon University Itabashi Hospital,
13
14 University of Miyazaki Hospital and Japanese Red Cross Tokushima Hospital.
15
16
17
18
19
20

21 **Consent**

22
23 The researchers will give the patients an informed consent form and explain the details of the
24
25 study before enrolment. The participant's request to withdraw consent during or after the
26
27 study will be accepted without any disadvantage.
28
29
30

31 **Access to data**

32
33 Investigators may use the EDC to review only case data collected at their site. In addition,
34
35 only the data administrator at the data centre has access to the case data entered from each
36
37 research site through the EDC.
38
39
40
41
42
43

44 **Confidentiality**

45
46 Three types of personal information will be used in this study: medical record number, date
47
48 of birth, and initials, which are the minimum required for identification and inquiry of the
49
50 participant. In addition, the participant's medical history and social background, which fall
51
52 under the category of personal information requiring special consideration, will be collected.
53
54 The date of birth will be collected in EDC for age calculation. Participant IDs and initials will
55
56 be used only in the correspondence table for each institution; this correspondence table will
57
58
59
60

1
2
3 not be provided to anyone other than the respective institutions. Sensitive personal
4
5 information will be collected in the EDC for use as the study's participant background.
6
7 The following measures will be taken to minimise the risk of information leakage when using
8
9 personal information in this study. First, all data obtained will be used only for the stated
10
11 purpose. EDC and ePRO systems that comply with the respective laws and regulations will
12
13 be used. Second, each research institute will create its correspondence table, which will not
14
15 be shared with other third-party institutions. Third, results will be analysed and reported in a
16
17 non-personally identifiable format. Fourth, in other respects, the Declaration of Helsinki, the
18
19 Act on the Protection of Personal Information, and the 'Ethical Guidelines for Life Sciences
20
21 and Medical Research Involving Human Subjects' will be followed.
22
23
24
25
26
27

28 **Dissemination policy**

29
30 The results of this study will be presented at major domestic and international conferences
31
32 and published in English.
33
34
35
36

37 **DISCUSSION**

38
39 This study aims to obtain a database for descriptive research on the status of irAEs, focusing
40
41 on symptom-related adverse events. It is the first multicentre collaborative study in Japan.
42
43 The profile of adverse events associated with ICIs differs from that of conventional cancer
44
45 drugs. Their use has diversified from monotherapy to combination with cytotoxic regimens;
46
47 management methods are not yet established. Furthermore, few studies presently use PRO-
48
49 CTCAE to evaluate irAEs with ICIs. Therefore, this study will provide information on
50
51 symptom-related adverse events for ICI-containing regimens in Japan, which is not fully
52
53 available during the development phase of treatment.
54
55
56
57
58
59
60

1
2
3 This study's database will be used to estimate the cumulative incidence of symptom-
4 related adverse events at 3, 6, 9, and 12 months, with 2 and 3 of the PRO-CTCAE response
5 options (from none to 0, 1, 2, 3, and 4) as onset events by carcinoma and regimen, and the
6 cumulative incidence of symptom-related. In addition, we are considering estimating the
7 duration of each symptom-related adverse event by defining the worsening of an adverse
8 event from baseline as an emergence event and the duration from the emergence of the
9 adverse event to the return to baseline as the duration of a symptom-related adverse event. As
10 mentioned earlier, there are still many unknowns regarding the occurrence of irAEs; this
11 study's database may provide information on trends in the occurrence of irAEs by carcinoma
12 and regimen. We are also considering summarising the records of ePRO confirmations with
13 descriptive statistics and examining the association between symptom-related adverse events
14 and the degree of pharmacist action (response options) as the reality of pharmacist action for
15 PRO-CTCAEs. This item could be more clinically relevant, leading to early detection and
16 treatment of irAEs through pharmacist action using the PRO-CTCAE. This could shorten the
17 duration of treatment for irAEs, avoid serious events, and allow cancer treatment progression,
18 demonstrating the pharmacist's professional ability and providing valuable feedback to
19 patients and the medical community.
20
21
22
23
24
25
26
27
28
29
30
31
32
33
34
35
36
37
38
39
40
41

42 The study protocol has some limitations. First, the study is a hypothetical,
43 unconventional, observational study. The number of patients was not determined by
44 statistical methods but rather based on the number of patients at participating sites. Second,
45 the items of symptom-related adverse events in this study were determined by reviewing
46 previous literature and Japanese drug package inserts and discussed by the investigators (four
47 oncology pharmacists). Therefore, it is impossible to collect information on the occurrence of
48 other symptoms. Third, participants with cognitive impairments or psychiatric disorders and
49 those unable to operate a smartphone or tablet are excluded from participation in this study.
50
51
52
53
54
55
56
57
58
59
60

1
2
3 Most of the excluded patients are likely to be older adults. Patients with cancer in real-world
4
5 practice are often older adults; age differences may be a barrier between the study and real-
6
7 world practice. Finally, the study did not employ an alarm function in the event of an urgent
8
9 irAE. Therefore, the medical community should be contacted in the event of an urgent irAE.
10
11

12 The RESPECT trial may provide critical information for future treatment with ICIs in
13
14 clinical practice by providing information on symptom-related adverse events that have not
15
16 been adequately obtained during the therapeutic development phase. In addition, information
17
18 about pharmacist actions after EDC confirmation could influence current outpatient follow-
19
20 up.
21
22

23 24 25 26 **Study status**

27
28 The study began enrolling patients in December 2021. The target enrolment is 260; as of
29
30 October 2022, 141 participants have been enrolled. Enrolment is scheduled to end on June
31
32 30, 2023. The research is conducted from October 15, 2021, to March 31, 2028.
33
34
35

36 37 38 **Acknowledgements**

39
40 The authors thank, in advance, all the participants, investigators, and institutions that will be
41
42 involved in this study.
43
44
45

46 47 48 **Authors' contributions**

49
50 AY contributed to the study conception and is the principal investigator. KA, TH, AT, DH,
51
52 TF, TK, MS, and TY participated in the study's design. TF, TK, and TY played a primary
53
54 role in designing the data management approach. TK and TY played a primary role in
55
56 designing statistical analysis. TM, TM, TK, and TY will conduct data analysis and
57
58 interpretation. KM, AT, TH, HA, YS, AK, MM, SO, CI, MF, NS, YT, MI, NM, TK, SH, AS,
59
60

1
2
3 YK, GA, YK, MO, TN, MO, TY, NM, AS, RI, KW, KI, ST, AU, TY, SW, and DT have
4
5 carried out recruitment and collected the data. All authors have read and approved the final
6
7 manuscript and meet the criteria for authorship as established by the International Committee
8
9 of Medical Journals Editors.
10
11
12
13

14 **Funding**

15
16 This work was supported by the Ministry of Health, Labour and Welfare (MHLW), the
17
18 Grant-in-Aid for Scientific Research on Administrative Measures, ‘Research Project for ICT
19
20 Infrastructure Development and Artificial Intelligence Implementation for Clinical Research’
21
22 , Evaluation of the efficacy of the Japanese version of PRO-CTCAE in actual clinical practice
23
24 and in clinical trials, grant number [20AC1002]–No funding has been received from specific
25
26 companies or organisations other than those listed above.
27
28
29
30
31
32

33 **Competing interests statement**

34
35 None declared.
36
37
38
39

40 **Patient and public involvement**

41
42 PPI was conducted per the Patient and Public Involvement (PPI) Guidebook of the National
43
44 Institute of Biomedical Research and Innovation (NIBIO)[22], Japan, at the research planning
45
46 stage. The following two patient groups were asked to cooperate in participation: NPO Lung
47
48 Cancer Patients Association One Step and General Incorporated Association Esophageal
49
50 Cancer Survivor's Sharing.
51
52
53
54
55

56 **Patient consent for publication**

57
58 Consent was obtained directly from participants.
59

STANDARD PROTOCOL ITEMS: RECOMMENDATIONS FOR INTERVENTIONAL TRIALS

SPIRIT 2013 Checklist: Recommended items to address in a clinical trial protocol and related documents*

| Section/item | Item No | Description | Page No. |
|-----------------------------------|---------|--|----------|
| Administrative information | | | |
| Title | 1 | Descriptive title identifying the study design, population, interventions, and, if applicable, trial acronym | 1 |
| Trial registration | 2a | Trial identifier and registry name. If not yet registered, name of intended registry | 4 |
| | 2b | All items from the World Health Organization Trial Registration Data Set | N/A |
| Protocol version | 3 | Date and version identifier | |
| Funding | 4 | Sources and types of financial, material, and other support | 18 |
| Roles and responsibilities | 5a | Names, affiliations, and roles of protocol contributors | 18 |
| | 5b | Name and contact information for the trial sponsor | N/A |
| | 5c | Role of study sponsor and funders, if any, in study design; collection, management, analysis, and interpretation of data; writing of the report; and the decision to submit the report for publication, including whether they will have ultimate authority over any of these activities | N/A |
| | 5d | Composition, roles, and responsibilities of the coordinating centre, steering committee, endpoint adjudication committee, data management team, and other individuals or groups overseeing the trial, if applicable (see Item 21a for data monitoring committee) | N/A |
| Introduction | | | |
| Background and rationale | 6a | Description of research question and justification for undertaking the trial, including summary of relevant studies (published and unpublished) examining benefits and harms for each intervention | 5-7 |

| | | | | |
|----|---|-----|---|-------|
| 1 | | 6b | Explanation for choice of comparators | |
| 2 | | | | |
| 3 | | | | |
| 4 | Objectives | 7 | Specific objectives or hypotheses | 7 |
| 5 | | | | |
| 6 | Trial design | 8 | Description of trial design including type of trial (eg, | 7 |
| 7 | | | parallel group, crossover, factorial, single group), | |
| 8 | | | allocation ratio, and framework (eg, superiority, | |
| 9 | | | equivalence, noninferiority, exploratory) | |
| 10 | | | | |
| 11 | | | | |
| 12 | Methods: Participants, interventions, and outcomes | | | |
| 13 | | | | |
| 14 | Study setting | 9 | Description of study settings (eg, community clinic, | 7 |
| 15 | | | academic hospital) and list of countries where data | |
| 16 | | | will be collected. Reference to where list of study sites | |
| 17 | | | can be obtained | |
| 18 | | | | |
| 19 | Eligibility criteria | 10 | Inclusion and exclusion criteria for participants. If | 8 |
| 20 | | | applicable, eligibility criteria for study centres and | |
| 21 | | | individuals who will perform the interventions (eg, | |
| 22 | | | surgeons, psychotherapists) | |
| 23 | | | | |
| 24 | | | | |
| 25 | Interventions | 11a | Interventions for each group with sufficient detail to | 8-10 |
| 26 | | | allow replication, including how and when they will be | |
| 27 | | | administered | |
| 28 | | | | |
| 29 | | | | |
| 30 | | 11b | Criteria for discontinuing or modifying allocated | 11-12 |
| 31 | | | interventions for a given trial participant (eg, drug | |
| 32 | | | dose change in response to harms, participant | |
| 33 | | | request, or improving/worsening disease) | |
| 34 | | | | |
| 35 | | 11c | Strategies to improve adherence to intervention | N/A |
| 36 | | | protocols, and any procedures for monitoring | |
| 37 | | | adherence (eg, drug tablet return, laboratory tests) | |
| 38 | | | | |
| 39 | | | | |
| 40 | | 11d | Relevant concomitant care and interventions that are | N/A |
| 41 | | | permitted or prohibited during the trial | |
| 42 | | | | |
| 43 | Outcomes | 12 | Primary, secondary, and other outcomes, including | 8-11 |
| 44 | | | the specific measurement variable (eg, systolic blood | |
| 45 | | | pressure), analysis metric (eg, change from baseline, | |
| 46 | | | final value, time to event), method of aggregation (eg, | |
| 47 | | | median, proportion), and time point for each outcome. | |
| 48 | | | Explanation of the clinical relevance of chosen | |
| 49 | | | efficacy and harm outcomes is strongly recommended | |
| 50 | | | | |
| 51 | | | | |
| 52 | Participant | 13 | Time schedule of enrolment, interventions (including | 11-12 |
| 53 | timeline | | any run-ins and washouts), assessments, and visits | |
| 54 | | | for participants. A schematic diagram is highly | |
| 55 | | | recommended (see Figure) | |
| 56 | | | | |
| 57 | | | | |
| 58 | | | | |
| 59 | | | | |
| 60 | | | | |

| | | | | |
|---|-------------|----|---|-------|
| 1 | | | | |
| 2 | Sample size | 14 | Estimated number of participants needed to achieve | 11 |
| 3 | | | study objectives and how it was determined, including | |
| 4 | | | clinical and statistical assumptions supporting any | |
| 5 | | | sample size calculations | |
| 6 | | | | |
| 7 | Recruitment | 15 | Strategies for achieving adequate participant | 11-12 |
| 8 | | | enrolment to reach target sample size | |
| 9 | | | | |

Methods: Assignment of interventions (for controlled trials)

Allocation:

| | | | | |
|----|----------------|-----|---|-----|
| 14 | Sequence | 16a | Method of generating the allocation sequence (eg, | N/A |
| 15 | generation | | computer-generated random numbers), and list of any | |
| 16 | | | factors for stratification. To reduce predictability of a | |
| 17 | | | random sequence, details of any planned restriction | |
| 18 | | | (eg, blocking) should be provided in a separate | |
| 19 | | | document that is unavailable to those who enrol | |
| 20 | | | participants or assign interventions | |
| 21 | | | | |
| 22 | | | | |
| 23 | | | | |
| 24 | Allocation | 16b | Mechanism of implementing the allocation sequence | N/A |
| 25 | concealment | | (eg, central telephone; sequentially numbered, | |
| 26 | mechanism | | opaque, sealed envelopes), describing any steps to | |
| 27 | | | conceal the sequence until interventions are assigned | |
| 28 | | | | |
| 29 | | | | |
| 30 | Implementation | 16c | Who will generate the allocation sequence, who will | N/A |
| 31 | | | enrol participants, and who will assign participants to | |
| 32 | | | interventions | |
| 33 | | | | |
| 34 | Blinding | 17a | Who will be blinded after assignment to interventions | N/A |
| 35 | (masking) | | (eg, trial participants, care providers, outcome | |
| 36 | | | assessors, data analysts), and how | |
| 37 | | | | |
| 38 | | | | |
| 39 | | 17b | If blinded, circumstances under which unblinding is | N/A |
| 40 | | | permissible, and procedure for revealing a | |
| 41 | | | participant's allocated intervention during the trial | |
| 42 | | | | |

Methods: Data collection, management, and analysis

| | | | | |
|----|-----------------|-----|--|-------|
| 45 | Data collection | 18a | Plans for assessment and collection of outcome, | 11-12 |
| 46 | methods | | baseline, and other trial data, including any related | |
| 47 | | | processes to promote data quality (eg, duplicate | |
| 48 | | | measurements, training of assessors) and a | |
| 49 | | | description of study instruments (eg, questionnaires, | |
| 50 | | | laboratory tests) along with their reliability and validity, | |
| 51 | | | if known. Reference to where data collection forms | |
| 52 | | | can be found, if not in the protocol | |
| 53 | | | | |
| 54 | | | | |
| 55 | | | | |
| 56 | | 18b | Plans to promote participant retention and complete | 11-12 |
| 57 | | | follow-up, including list of any outcome data to be | |
| 58 | | | collected for participants who discontinue or deviate | |
| 59 | | | from intervention protocols | |
| 60 | | | | |

| | | | | |
|----|---------------------------------|-----|---|-------|
| 1 | | | | |
| 2 | Data | 19 | Plans for data entry, coding, security, and storage, | 12 |
| 3 | management | | including any related processes to promote data | |
| 4 | | | quality (eg, double data entry; range checks for data | |
| 5 | | | values). Reference to where details of data | |
| 6 | | | management procedures can be found, if not in the | |
| 7 | | | protocol | |
| 8 | | | | |
| 9 | | | | |
| 10 | Statistical | 20a | Statistical methods for analysing primary and | 13 |
| 11 | methods | | secondary outcomes. Reference to where other | |
| 12 | | | details of the statistical analysis plan can be found, if | |
| 13 | | | not in the protocol | |
| 14 | | | | |
| 15 | | 20b | Methods for any additional analyses (eg, subgroup | 13 |
| 16 | | | and adjusted analyses) | |
| 17 | | | | |
| 18 | | | | |
| 19 | | 20c | Definition of analysis population relating to protocol | 13 |
| 20 | | | non-adherence (eg, as randomised analysis), and any | |
| 21 | | | statistical methods to handle missing data (eg, | |
| 22 | | | multiple imputation) | |
| 23 | | | | |
| 24 | | | | |
| 25 | Methods: Monitoring | | | |
| 26 | Data monitoring | 21a | Composition of data monitoring committee (DMC); | 12 |
| 27 | | | summary of its role and reporting structure; statement | |
| 28 | | | of whether it is independent from the sponsor and | |
| 29 | | | competing interests; and reference to where further | |
| 30 | | | details about its charter can be found, if not in the | |
| 31 | | | protocol. Alternatively, an explanation of why a DMC | |
| 32 | | | is not needed | |
| 33 | | | | |
| 34 | | | | |
| 35 | | | | |
| 36 | | 21b | Description of any interim analyses and stopping | 12 |
| 37 | | | guidelines, including who will have access to these | |
| 38 | | | interim results and make the final decision to | |
| 39 | | | terminate the trial | |
| 40 | | | | |
| 41 | | | | |
| 42 | Harms | 22 | Plans for collecting, assessing, reporting, and | 12-13 |
| 43 | | | managing solicited and spontaneously reported | |
| 44 | | | adverse events and other unintended effects of trial | |
| 45 | | | interventions or trial conduct | |
| 46 | | | | |
| 47 | Auditing | 23 | Frequency and procedures for auditing trial conduct, if | 12 |
| 48 | | | any, and whether the process will be independent | |
| 49 | | | from investigators and the sponsor | |
| 50 | | | | |
| 51 | | | | |
| 52 | Ethics and dissemination | | | |
| 53 | | | | |
| 54 | Research ethics | 24 | Plans for seeking research ethics | 13-14 |
| 55 | approval | | committee/institutional review board (REC/IRB) | |
| 56 | | | approval | |
| 57 | | | | |
| 58 | | | | |
| 59 | | | | |
| 60 | | | | |

| | | | | |
|----|-------------------|-----|--|-------|
| 1 | | | | |
| 2 | Protocol | 25 | Plans for communicating important protocol | 14 |
| 3 | amendments | | modifications (eg, changes to eligibility criteria, | |
| 4 | | | outcomes, analyses) to relevant parties (eg, | |
| 5 | | | investigators, REC/IRBs, trial participants, trial | |
| 6 | | | registries, journals, regulators) | |
| 7 | | | | |
| 8 | Consent or | 26a | Who will obtain informed consent or assent from | 14 |
| 9 | assent | | potential trial participants or authorised surrogates, | |
| 10 | | | and how (see Item 32) | |
| 11 | | | | |
| 12 | | | | |
| 13 | | 26b | Additional consent provisions for collection and use of | 14 |
| 14 | | | participant data and biological specimens in ancillary | |
| 15 | | | studies, if applicable | |
| 16 | | | | |
| 17 | Confidentiality | 27 | How personal information about potential and enrolled | 14-15 |
| 18 | | | participants will be collected, shared, and maintained | |
| 19 | | | in order to protect confidentiality before, during, and | |
| 20 | | | after the trial | |
| 21 | | | | |
| 22 | | | | |
| 23 | Declaration of | 28 | Financial and other competing interests for principal | 18 |
| 24 | interests | | investigators for the overall trial and each study site | |
| 25 | | | | |

28

29 30 **ABSTRACT** 31

32
33 **Introduction:** The use of immune checkpoint inhibitors (ICIs) is rapidly expanding in cancer
34 treatment. ICIs have a unique safety profile, characterised by immune-related adverse events
35 (irAEs). The safety profile of ICIs lacks patient experience and perspectives. This study
36
37 primarily aims to obtain a database for descriptive research on the status of irAEs using the
38 Patient-Reported Outcomes version of the Common Terminology Criteria (PRO-CTCAE) in
39 patients with gastrointestinal cancer, lung cancer, and malignant pleural mesothelioma treated
40 with regimens containing ICIs.
41
42
43
44
45
46
47
48

49 **Methods and analysis:** This is an ongoing, multicentre, observational study in Japan.
50
51 Eligible patients must be at least 20 years and have been diagnosed with lung cancer,
52 malignant pleural mesothelioma, or gastrointestinal cancer and plan to use ICIs. Participants
53 will install the electronic PRO (ePRO) application and report adverse events via ePRO using
54 PRO-CTCAE once weekly for up to 48 weeks. A registry will be established using
55
56
57
58
59
60

1
2
3 background information obtained from medical records. The sample size is determined by
4
5 one-year projection without using statistical methods. Statistical analyses will include point
6
7 estimates and 95% confidence intervals for the incidence of each adverse event by cancer
8
9 type and regimen at each time point.
10
11

12 **Ethics and dissemination:** This research will be conducted per the Declaration of Helsinki,
13
14 the Ethical Guidelines for Life Science and Medical Research Involving Human Subjects
15
16 issued by the Ministry of Education, Culture, Sports, Science and Technology and the
17
18 Ministry of Health, Labor and Welfare, and the revised Personal Information Protection Law.
19
20 The study protocol was approved by the Ethics Committee (approval ID T2021-0180) of
21
22 Tokyo Medical University Hospital on October 15, 2021.
23
24
25

26 **Registration details:** The study began enrolling patients in December 2021. The target
27
28 enrolment is 260; as of October 2022, 141 have been enrolled, and the enrolment is scheduled
29
30 to end on June 30, 2023.

38
39

40 **STRENGTHS AND LIMITATIONS OF THE STUDY**

41

- 42 • Insufficient information on symptom-related adverse events of regimens containing
43 immune checkpoint inhibitors can be clarified.
44
- 45 • Multiple insights into adverse event monitoring using PRO-CTCAE via ePRO, which
46 can collect adverse events in real-time without patient visits in Japanese clinical
47 practice settings, can be provided.
48
- 49 • The selected items of PRO-CTCAE in this study were determined by reviewing
50 previous literature and Japanese drug package inserts and discussed by a board-
51 certified oncology pharmacy specialists and through patient public involvement.
52
53
54
55
56
57
58
59
60

- A limitation of this study is that patients cannot be evaluated for PRO-CTCAE items not selected by the investigator at the time of planning. Not all patient-reported safety profiles are available.

INTRODUCTION

In 2017, the number of malignant tumour (cancer) patients and deaths worldwide were 24.5 million and 9.6 million, respectively.[1] The number of cancer patients in Japan was 775,601 in 2009.[2] Cancer treatment centres on surgery, drug therapy, and radiation therapy. Recently, immunotherapy has attracted attention, and insurance coverage for immune checkpoint inhibitors (ICIs) is rapidly expanding. The following cancer types are currently covered by insurance in Japan: non-small cell lung cancer, small cell lung cancer, malignant pleural mesothelioma, oesophageal cancer, gastric cancer, colorectal cancer, hepatocellular cancer, head and neck cancer, breast cancer, cervical cancer, uterine cancer, urothelial cancer, renal cancer, melanoma, solid tumours with high microsatellite instability-high (MSI-H), tumour mutational burden-high (TMB-H), and Hodgkin's lymphoma. Among the cancers for which ICIs are indicated, in which respiratory and gastrointestinal cancers are the most common, 103,715 cases were lung cancer, 122,632 gastric cancer, 116,342 colorectal cancer, 48,003 liver cancer, and 20,787 oesophageal cancer in 2009 in Japan.[2]

Adverse events in ICI treatment differ from those of conventional cytotoxic anticancer and molecular-targeted drugs in that they may present with specific autoimmune-like immune-related adverse events (irAEs).[3] Although irAEs are relatively common in the skin, gastrointestinal tract, liver, lung, and endocrine organs, they can theoretically occur anywhere in the body.[4] IrAEs can occur at any time after the start and even after the completion of ICI administration.[5] Ipilimumab is reported to cause more skin irAEs after 2–3 weeks, gastrointestinal and hepatic after 6–7 weeks, and endocrinal after 9 weeks.[6] In

1
2
3 contrast, nivolumab is reported to cause more skin irAEs after 5 weeks; gastrointestinal,
4
5 hepatic, and pulmonary after 7–8 weeks, endocrinal after 10 weeks, and renal after 15
6
7 weeks.[7] However, most irAEs were reported to occur within 6 months of prolonged
8
9 treatment with nivolumab and were not cumulative.[8] Although careful monitoring is
10
11 recommended after ICI administration, there is no settled opinion on the monitoring period.
12
13 IrAEs should be monitored by a physician or a physician's assistant. The response varies by
14
15 organ, but as a general rule, the administration should be postponed or interrupted when \geq
16
17 Grade 2 is reached; systemic corticosteroids should be considered. After starting treatment
18
19 with steroids, it is recommended that they be tapered off over several weeks while checking
20
21 for irAE recurrence and subsequently discontinued or adjusted to a low-maintenance dose.[9,

 Patient-reported outcome (PRO) is defined as ‘an evaluation method in which patients judge their symptoms and quality of life; the results are obtained without any intervention from doctors or other parties’ by the Food and Drug Administration.[11] In recent years, adverse event assessment using PROs has gained prominence in oncology. Basch et al.[12] reported that adverse event assessments in providers and patients are inconsistent, with a tendency for providers to underestimate them. This problem led to the development of a PRO version of the Common Terminology Criteria for Adverse Events (CTCAE), PRO-CTCAE, in 2008. In a randomised controlled trial, a comparison of the pro-active approach with PRO-CTCAE using electronic PRO (ePRO) for adverse events with a conventional adverse event evaluation showed a significant difference in health-related quality of life and overall survival.[13] This study has attracted attention as a trial that will change clinical practice. The results have led to the use of PRO-CTCAE in many countries, including Japan.

 Early detection and monitoring of irAEs are important, and PROs are useful.[14] However, Tolstrup et al.[15] noted that the procedure for selecting PRO-CTCAE items in

1
2
3 patients receiving immunotherapy is not well established. They reported a method for
4 selecting PRO-CTCAE questions for patients with malignant melanoma receiving
5 immunotherapy. Studies of PRO-CTCAE in ICI-using patients have been reported in
6 malignant melanoma and non-small cell lung cancer.[16, 17] Based on these studies, the
7 PRO-CTCAE is used as a questionnaire to evaluate irAE; however, few studies on irAE and
8 PRO-CTCAE are available.
9

10
11
12 In Japan, pharmacists play an important role in the rapidly advancing field of cancer
13 pharmacotherapy. Particularly, with the increase in outpatient cancer treatment, there have
14 been many reports on the importance and usefulness of outpatient consultations conducted by
15 pharmacists. This report suggests that in addition to routine tasks such as checking lab values
16 and providing medication guidance, working with physicians and nurses to conduct pre- and
17 post-consultation interviews not only benefits patients but also helps to reduce the burden on
18 medical staff and improve the quality of care.[18, 19]
19

20
21
22 The present study, named RESPECT (REGistry Study of immune-related adverse
23 events using electronic Patient-reported outcome in patiEnts with cancer receiving immune
24 Checkpoint inhibitors) study, aims to obtain a database for descriptive research on the status
25 of irAEs, focusing on symptom-related adverse events in patients with cancer receiving
26 regimens that include ICIs. In addition, it aims to determine the rate of symptom-related
27 adverse events at each time point in the setting in which ePRO adverse event monitoring is
28 performed.
29

30 31 32 **METHODS AND ANALYSIS**

33 34 35 **Study design**

36
37
38 This is an ongoing, multicentre, longitudinal, observational study. An observational study
39 design is used to track the mode and course of irAEs, focusing on symptom-related adverse

2
3 events. Participants will install the ePRO application and report adverse events weekly via
4
5 ePRO using PRO-CTCAE. In addition, a registry will be established using background
6
7 information obtained from medical records; ancillary studies will be conducted on the
8
9 proportion of adverse event reporting by ePRO and those associated with ICIs.
10
11
12
13

14 **Patient and public involvement**

15
16 The following two patient groups were asked to cooperate in participation: Non-Profit
17
18 Organization Lung Cancer Patients Association One Step and General Incorporated
19
20 Association Esophageal Cancer Survivor's Sharing. The research plan will include the advice
21
22 given on PRO-CTCAE item selection, number of questions, and survey frequency. Advice
23
24 will also be obtained at each stage of the process leading up to the publication of the results.
25
26
27
28
29

30 **Study setting, participants, and recruitment**

31
32 Recruitment is being performed at nine hospitals in Japan. The inclusion criterion is the
33
34 diagnosis of lung cancer, malignant pleural mesothelioma, or gastrointestinal cancer in
35
36 patients who plan to use an ICI and give their written consent to participate in the study, over
37
38 20 years old, and with Eastern Collaborative Oncology Group Performance Status (ECOG
39
40 PS) of 0–3. Patients who do not have an ePRO-eligible device, have a severe psychiatric
41
42 illness or cognitive dysfunction that affects filling out the survey form, or those with a native
43
44 language that is not Japanese are excluded. The study pharmacist will invite eligible patients
45
46 to participate in the study at each site. After starting treatment, participants will complete
47
48 weekly ePROs, an adverse events monitoring questionnaires at week 12, and treatment
49
50 satisfaction questionnaires at weeks 24 and 48. Observation shall be discontinued in the
51
52 following cases: (1) if the participant requests to discontinue the adverse event evaluation
53
54
55
56
57
58
59
60

1
2
3 using ePRO, (2) when follow-up is no longer possible due to hospital transfer, (3) death
4 during follow-up, (4) if consent is withdrawn, and (5) loss to follow-up.
5
6
7
8
9

10 **Outcome measures**

11
12 Table 1 shows the study schedule. We will use the PRO-CTCAE and the CTCAE v5.0 to
13 assess adverse events. In addition, we will use Cancer Therapy Satisfaction Questionnaire
14 (CTSQ) to assess treatment satisfaction.

eCRF, Electronic case report form.

○, Medical Professionals Valuation; ●, Participant assessment

Adverse events

Adverse events will be assessed using CTCAE v5.0, translated by the Japan Clinical Oncology Group as Clinician-Reported Outcome (ClinRO), and PRO-CTCAE as PRO. Since its development as a common toxicity criterion in 1984, the CTCAE has been the gold standard as ClinRO for adverse event assessment and is widely used in clinical research, particularly in the field of oncology. The CTCAE v5.0 will be recorded from the medical record each time they are assessed; items corresponding to PRO-CTCAE will be mandatory. Meanwhile, the PRO-CTCAE, developed by the National Cancer Institute in 2008, consists of 80 items from the CTCAE version 4, extracting 78 symptoms that can be subjectively assessed by the patients and has been reworded to make them easier for patients to answer. Each item is assessed using one or more attributes, including presence/absence, frequency, severity, and/or interference with usual or daily activities. The original version has been evaluated for validity and reliability by Dueck et al.[20] The Japanese version of PRO-CTCAE has been validated for linguistic and psychometric validity by Miyaji et al.[21] and Kawaguchi et al.[22], respectively.

Treatment satisfaction

The CTSQ is a 16-item questionnaire developed by Pfizer to measure treatment satisfaction specifically with cancer treatment. It has three subscales, 'Expectations of Treatment', 'Feelings about Side Effects', and 'Satisfaction with Therapy', which are scored from 0 to 100. Higher scores indicate higher satisfaction. This questionnaire has been validated by Abetz et al.[23]

Sample size determination

1
2
3 The sample size was not calculated based on a statistical perspective. Considering the annual
4 number of patients treated with ICIs at each site and the proportion of smartphone or tablet
5 ownership for ePRO, and obtaining consent, a target enrolment number of at least 260
6 patients per year was set.
7
8
9
10
11
12
13

14 **Data collection and timeline**

15
16 The study pharmacist will perform web registration for the participants' data using the
17 electronic data capture (EDC) system, Viedoc 4 (Viedoc Technologies, Sweden). Participants
18 will respond to the PROs using 3H P-Guardian (3H Clinical Trial Inc, Japan), an ePRO
19 application, on their own device (smartphone or tablet) at 49 time points: at baseline and
20 weeks 1–48 after initiating ICI therapy. The oncologist and/or study pharmacist will explain
21 the details of this research to the patient. After obtaining patient consent, data on
22 psychosocial background and PRO-CTCAE will be collected from the participant's electronic
23 device. Data on demographics, medical history, and CTCAE v5.0- JCOG scores will be
24 collected and entered into EDC and linked to baseline PRO data. The study pharmacist will
25 review ePRO data within the scope of their routine daily practice and, based on this
26 information, share information with physicians and nurses, and contact and respond to
27 participants, but there are no restrictions or interventions since this is for research study
28 purposes. After the study pharmacist has reviewed the ePRO data, they will record in the EDC
29 whether they have contacted the physician, nurse, or patient, and if so, the details of that
30 action. They will also be asked to record treatment satisfaction at weeks 24 and 48. Adverse
31 event assessment using CTCAE and PRO-CTCAE will continue after treatment with ICIs is
32 discontinued. The study timeline is shown in Table 1.

58 **Data monitoring**

1
2
3 The data centre is located at the Tohoku Graduate School of Medicine (Miyagi Prefecture,
4 Japan). To protect participants' privacy, no personally identifiable information will be
5 entered into the EDC. Data management and central data monitoring will be performed using
6 the EDC. Establishment of a data monitoring committee and auditing are not planned for this
7 study. Following the data entry of this study, the fixed data will be exported and deleted from
8 the EDC and will be stored in the research office in electronic media for at least 10 years after
9 the principal publication.

21 **Harm**

22
23 This is a non-interventional, non-invasive, observational study. Therefore, the burden on the
24 participants is minimal. Participant contributions for time spent filling out questionnaires,
25 installing applications, and communication costs for data transmission will be explained in
26 writing and verbally in the consent explanation. Consent will be fully explained before
27 enrolment, and participants can withdraw even while the questionnaire is being filled out.

38 **Statistical analysis**

39
40 The primary purpose is to obtain a database for descriptive research on the actual status of
41 irAEs, focusing on symptom-related adverse events in patients with cancer receiving
42 regimens that include ICIs. Furthermore, we aim to determine the incidence of symptom-
43 related adverse events at each time point in an environment where ePRO-based adverse event
44 monitoring is conducted in daily practice. Point estimates and 95% confidence intervals of
45 the incidence of each adverse event at each time point by cancer type and regimen will be
46 estimated. The treatment of missing values will not be specified in advance. In addition, we
47 will examine the association between symptom-related adverse events and the extent of

6
7
8
9

10 **ETHICS AND DISSEMINATION**

11 **Research ethical approval**

12
13
14 This research will be conducted per the Declaration of Helsinki, the Ethical Guidelines for
15
16 Life Science and Medical Research Involving Human Subjects issued by the Ministry of
17
18 Education, Culture, Sports, Science and Technology and the Ministry of Health, Labor and
19
20 Welfare, and the revised Personal Information Protection Law. The protocol was approved by
21
22 the Ethics Committee of Tokyo Medical University Hospital (approval ID T2021-0180) on
23
24 October 15, 2021. The version of the protocol became 1.1 in March 2022. The protocol has
25
26 been reviewed by the Institutional Review Boards of the following research centres. Juntendo
27
28 University Nerima Hospital, JR Tokyo General Hospital, Nippon Medical School Hospital,
29
30 Kyorin University Hospital, Teine Keijinkai Hospital, Nihon University Itabashi Hospital,
31
32 University of Miyazaki Hospital and Japanese Red Cross Tokushima Hospital.
33
34
35
36
37
38
39

40 **Consent**

41
42 The study pharmacist and/or the oncologist will give the patients an informed consent form
43
44 and explain the details of the study before enrolment. The participant's request to withdraw
45
46 consent during or after the study will be accepted without any disadvantage.
47
48
49

50 **Access to data**

51
52 The study pharmacist and/or the oncologist may use the EDC to review only case data
53
54 collected at their site. In addition, only the data manager at the data centre has access to the
55
56 case data entered from each research site through the EDC.
57
58
59
60

Confidentiality

Three types of personal information will be used in this study: medical record number, date of birth, and initials, which are the minimum required for identification and inquiry of the participant. In addition, the participant's medical history and social background, which fall under the category of personal information requiring special consideration, will be collected.

The date of birth will be collected in EDC for age calculation. Participant IDs and initials will be used only in the correspondence table for each institution; this correspondence table will not be provided to anyone other than the respective institutions. Sensitive personal information will be collected in the EDC for use as the study's participant background.

The following measures will be taken to minimise the risk of information leakage when using personal information in this study. First, all data obtained will be used only for the stated purpose. EDC and ePRO systems that comply with the respective laws and regulations will be used. Second, each research institute will create its correspondence table, which will not be shared with other third-party institutions. Third, results will be analysed and reported in a non-personally identifiable format. Fourth, in other respects, the Declaration of Helsinki, the Act on the Protection of Personal Information, and the 'Ethical Guidelines for Life Sciences and Medical Research Involving Human Subjects' will be followed.

Dissemination policy

The results of this study will be presented at major domestic and international conferences and published in English.

DISCUSSION

1
2
3 This study aims to obtain a database for descriptive research on the status of irAEs,
4 focusing on symptom-related adverse events. It is the first multicentre collaborative study in
5 Japan. The profile of adverse events associated with ICIs differs from that of conventional
6 cancer drugs. Their use has diversified from monotherapy to combination with cytotoxic
7 regimens; management methods are not yet established. Furthermore, few studies presently
8 use PRO-CTCAE to evaluate irAEs with ICIs. Therefore, this study will provide information
9 on symptom-related adverse events for ICI-containing regimens in Japan, which is not fully
10 available during the clinical trials in which adverse events were assessed only by ClinRO.
11
12
13
14
15
16
17
18
19
20

21 This study's database will be used to estimate the cumulative incidence of symptom-
22 related adverse events at 3, 6, 9, and 12 months, with 2 and 3 of the PRO-CTCAE response
23 options (from none to 0, 1, 2, 3, and 4) as onset events by carcinoma and regimen. In
24 addition, we are considering estimating the duration of each symptom-related adverse event
25 by defining the worsening of an adverse event from baseline as an emergence event and the
26 duration from the emergence of the adverse event to the return to baseline as the duration of a
27 symptom-related adverse event. As mentioned earlier, there are still many unknowns
28 regarding the occurrence of irAEs; this study's database may provide information on trends
29 in the occurrence of irAEs by carcinoma and regimen. We are also considering summarising
30 the records of ePRO confirmations with descriptive statistics and examining the association
31 between symptom-related adverse events and the degree of pharmacist action (response
32 options) as the reality of pharmacist action for PRO-CTCAEs. This item could be more
33 clinically relevant, leading to early detection and treatment of irAEs through pharmacist
34 action using the PRO-CTCAE. This could shorten the duration of treatment for irAEs, avoid
35 serious events, and allow cancer treatment progression, demonstrating the pharmacist's
36 professional ability and providing valuable feedback to patients and the medical community.

1
2
3 The study protocol has some limitations. First, the study is a hypothetical,
4 unconventional, observational study, and it does not include patients with all cancer types for
5 which ICIs can be administered. Additionally, the number of patients was not determined by
6 statistical methods but rather based on the number of patients at participating sites. Therefore,
7 there are limitations with respect to generalizability. Second, the items of symptom-related
8 adverse events in this study were determined by reviewing previous literature and Japanese
9 drug package inserts and discussed by four oncology pharmacists. Therefore, it is impossible
10 to collect information on the occurrence of other symptoms. Third, participants with
11 cognitive impairments or psychiatric disorders and those unable to operate a smartphone or
12 tablet are excluded from participation in this study. Most of the excluded patients are likely to
13 be older adults. Patients with cancer in real-world practice are often older adults; age
14 differences may be a barrier between the study and real-world practice.

25
26
27
28
29
30
31 The RESPECT trial may provide critical information for future treatment with ICIs in
32 clinical practice by providing information on symptom-related adverse events that have not
33 been adequately obtained during the clinical trials conducted before approval. In fact, the
34 adverse event assessments from our registry will not only provide the “worst grade during
35 time period” used in general cancer clinical trials, but also provide cumulative incidence rates
36 and changes over time by ICIs, their regimens, or by cancer type, based on temporal changes
37 such as onset and resolution of adverse event ratings.

48 49 **Study status**

50
51 The study began enrolling patients in December 2021. The target enrolment is 260; as of
52 October 2022, 141 participants have been enrolled. Enrollment is scheduled to end on June
53 30, 2023. The research is to be conducted from October 15, 2021, to March 31, 2028.

Acknowledgements

The authors thank, in advance, all the participants, investigators, and institutions that will be involved in this study.

Authors' contributions

AY contributed to the study conception and is the principal investigator. KA, TH, AT, DH, TF, TK, MS, and TY participated in the study's design. TF, TK, and TY played a primary role in designing the data management approach. TK and TY played a primary role in designing statistical analysis. TM, TM, TK, and TY will conduct data analysis and interpretation. KM, AT, TH, HA, YS, AK, MM, SO, CI, MF, NS, YT, MI, NM, TK, SH, AS, YK, GA, YK, MO, TN, MO, TY, NM, AS, RI, KW, KI, ST, AU, TY, SW, and DT have carried out recruitment and collected the data. All authors have read and approved the final manuscript and meet the criteria for authorship as established by the International Committee of Medical Journals Editors.

Funding

This work was supported by the Ministry of Health, Labour and Welfare (MHLW), the Grant-in-Aid for Scientific Research on Administrative Measures, 'Research Project for ICT Infrastructure Development and Artificial Intelligence Implementation for Clinical Research', Evaluation of the efficacy of the Japanese version of PRO-CTCAE in actual clinical practice and in clinical trials, grant number [20AC1002]. No funding has been received from specific companies or organisations other than those listed above.

Competing interests statement

None declared.

Patient and public involvement

PPI was conducted per the Patient and Public Involvement (PPI) Guidebook of the National Institute of Biomedical Research and Innovation (NIBIO)[24], Japan, at the research planning stage. The following two patient groups were asked to cooperate in participation: NPO Lung Cancer Patients Association One Step and General Incorporated Association Esophageal Cancer Survivor's Sharing.

Patient consent for publication

Consent was obtained directly from participants.

Provenance and peer review

Not commissioned; externally peer-reviewed.

Open access

electronic case report form.

The RECORD statement – checklist of items, extended from the STROBE statement, that should be reported in observational studies using routinely collected health data.

| | Item No. | STROBE items | Location in manuscript where items are reported (page numbers) | RECORD items | Location in manuscript where items are reported (page numbers) |
|---------------------------|----------|--|--|---|--|
| Title and abstract | | | | | |
| | 1 | (a) Indicate the study's design with a commonly used term in the title or the abstract (b) Provide in the abstract an informative and balanced summary of what was done and what was found | | RECORD 1.1: The type of data used should be specified in the title or abstract. When possible, the name of the databases used should be included. RECORD 1.2: If applicable, the geographic region and timeframe within which the study took place should be reported in the title or abstract. RECORD 1.3: If linkage between databases was conducted for the study, this should be clearly stated in the title or abstract. | (1) |
| Introduction | | | | | |
| Background rationale | 2 | Explain the scientific background and rationale for the investigation being reported | (6-8) | | |
| Objectives | 3 | State specific objectives, including any prespecified hypotheses | (9) | | |
| Methods | | | | | |
| Study Design | 4 | Present key elements of study design early in the paper | (9) | | |

| | | | | | |
|--------------|---|--|---------|--|---------|
| Setting | 5 | Describe the setting, locations, and relevant dates, including periods of recruitment, exposure, follow-up, and data collection | (10-11) | | |
| Participants | 6 | <p>(a) <i>Cohort study</i> - Give the eligibility criteria, and the sources and methods of selection of participants. Describe methods of follow-up</p> <p><i>Case-control study</i> - Give the eligibility criteria, and the sources and methods of case ascertainment and control selection. Give the rationale for the choice of cases and controls</p> <p><i>Cross-sectional study</i> - Give the eligibility criteria, and the sources and methods of selection of participants</p> <p>(b) <i>Cohort study</i> - For matched studies, give matching criteria and number of exposed and unexposed</p> <p><i>Case-control study</i> - For matched studies, give matching criteria and the number of controls per case</p> | | <p>RECORD 6.1: The methods of study population selection (such as codes or algorithms used to identify subjects) should be listed in detail. If this is not possible, an explanation should be provided.</p> <p>RECORD 6.2: Any validation studies of the codes or algorithms used to select the population should be referenced. If validation was conducted for this study and not published elsewhere, detailed methods and results should be provided.</p> <p>RECORD 6.3: If the study involved linkage of databases, consider use of a flow diagram or other graphical display to demonstrate the data linkage process, including the number of individuals with linked data at each stage.</p> | (10-11) |
| Variables | 7 | Clearly define all outcomes, exposures, predictors, potential confounders, and effect modifiers. Give diagnostic criteria, if applicable. | | RECORD 7.1: A complete list of codes and algorithms used to classify exposures, outcomes, confounders, and effect modifiers should be provided. If these cannot be reported, an explanation should be provided. | (17-18) |

| | | | | | | |
|--|------------------------------|----|--|---------|--|--|
| 1 2 3 4 5 6 7 | Data sources/ measurement | 8 | For each variable of interest, give sources of data and details of methods of assessment (measurement). Describe comparability of assessment methods if there is more than one group | (18) | | |
| 8 9 | Bias | 9 | Describe any efforts to address potential sources of bias | (18-19) | | |
| 10 11 12 13 | Study size | 10 | Explain how the study size was arrived at | (17) | | |
| 14 15 16 17 18 19 20 | Quantitative variables | 11 | Explain how quantitative variables were handled in the analyses. If applicable, describe which groupings were chosen, and why | (17-18) | | |

| | | | | | |
|-------------------|----|--|---------|--|--|
| Outcome data | 15 | <i>Cohort study</i> - Report numbers of outcome events or summary measures over time <i>Case-control study</i> - Report numbers in each exposure | N/A | | |
| | | category, or summary measures of exposure <i>Cross-sectional study</i> - Report numbers of outcome events or summary measures | | | |
| Main results | 16 | (a) Give unadjusted estimates and, if applicable, confounderadjusted estimates and their precision (e.g., 95% confidence interval). Make clear which confounders were adjusted for and why they were included (b) Report category boundaries when continuous variables were categorized (c) If relevant, consider translating estimates of relative risk into absolute risk for a meaningful time period | N/A | | |
| Other analyses | 17 | Report other analyses done— e.g., analyses of subgroups and interactions, and sensitivity analyses | N/A | | |
| Discussion | | | | | |
| Key results | 18 | Summarise key results with reference to study objectives | (22-24) | | |

| | | | | | | |
|--|---|----|--|---------|--|------|
| 1 2 3 4 5 6 7 8 9 10 | Limitations | 19 | Discuss limitations of the study, taking into account sources of potential bias or imprecision. Discuss both direction and magnitude of any potential bias | | RECORD 19.1: Discuss the implications of using data that were not created or collected to answer the specific research question(s). Include discussion of misclassification bias, unmeasured confounding, missing data, and changing eligibility over time, as they pertain to the study being reported. | N/A |
| 11 12 13 14 15 16 17 18 19 | Interpretation | 20 | Give a cautious overall interpretation of results considering objectives, limitations, multiplicity of analyses, results from similar studies, and other relevant evidence | (23-24) | | |
| 20 21 22 23 | Generalisability | 21 | Discuss the generalisability (external validity) of the study results | (24) | | |
| 24 | Other Information | | | | | |
| 25 26 27 28 29 30 | Funding | 22 | Give the source of funding and the role of the funders for the present study and, if applicable, for the original study on which the present article is based | (26) | | |
| 31 32 33 34 35 36 37 | Accessibility of protocol, raw data, and programming code | | .. | | RECORD 22.1: Authors should provide information on how to access any supplemental information such as the study protocol, raw data, or programming code. | (16) |
