Multiple risk behaviours Sensitivity analyses Appendix 17. Assessment of publication bias/small study effects Appendix 18. Summary of findings and certainty of evidence Appendix 19. PRISMA checklists Appendix 20. Registered/published protocols	

Appendix 1. Deviations from protocol

To improve the interpretability and comparability of the review findings, we made the following explanatory clarifications and minor protocol deviations.

Clarifications to and deviations from protocol as published:

- Updated the search to include all eligible studies from 01/1997-06/2022.
- Clarified online dating platforms were not included under the exposure social media use.
- Clarified randomised control trials were eligible for inclusion.
- Clarified the risk of bias tool to be used for randomised control trials is the Cochrane RoB-2 tool.
- We did not include ethnicity as a critical confounding factor when assessing study adjustment as the potential role of ethnicity as a confounder was not deemed substantial given the likely homogenous populations investigated within many included studies.
- We included online (social) gaming and online (social) gambling within included exposures following discussions with advisory group members, due to their emerging placement in social media platforms and the overlap in functionalities they share with social media.
- For planned subgroup analyses/meta-regression we originally stated if two or fewer studies were found in a given sub-category of a binary/multi-categorical moderator, formal moderation analysis would not be conducted for that specific variable. Due to the limited number of included studies, we allowed for more leniency using the data available and the decision was made to perform subgroup analyses/meta-regression <u>if at least one</u> subgroup had two or more studies, noting the requirement to interpret any conclusions with caution. The same rule was applied when conducting sensitivity analyses.
- Where duplicate data were identified across multiple studies, we prioritised inclusion of studies which had the longest period of follow up, followed by studies which had the largest most representative sample size, and then by most recent. We did not anticipate there would be many cohort studies identified during protocol development, thus we did not initially prioritise the inclusion of studies with longer follow up periods.
- Following discussions with statistical experts post publication of the protocol, the decision was made to combine binary exposure and binary/continuous outcomes in line with guidance provide by Cochrane,¹ expressed as odds ratios. For continuous exposure measures, we stated estimates would be converted to standardised regression coefficients/correlations. Where possible we converted regression coefficients to standardised regression coefficients. We used the recent method recommended by Mathur and Vanderwheele² which facilitates the conversion of a Pearson correlation coefficient to standardised mean difference.
- We conducted a post-hoc GRADE assessment for the exposure to health-risk behaviour content on social media and outcome unhealthy dietary behaviour due to the substantial differences in the studies used to assess this exposure/outcome combination (specifically investigation by randomised control trials).

Appendix 2. Details of search strategies conducted

All searches outlined in Table A were initially conducted on 30.04.2020 and repeated on 06.06.2022.

Appendix 4. Process of social media categorisation

All social media categories outlined in the SAGE Social Media Categorisation³ (Table A) were eligible for inclusion. Online (social) gambling and online (social) gaming were deemed eligible exposures due to their inclusion of core social media functionalities, namely interaction between users.^{4,5,6}

As the functionalities of social media platforms overlap, and social media platforms may fall into several social media categories, we made efforts to categorise using the initial premise/purpose of the platform if stated. For example, the social media platform Instagram possesses functionalities central to social networking sites however its initial premise/purpose was to facilitate media-sharing. Therefore, where a study reported Instagram use, this was classified under the social media category media-sharing. Where an included study reported use of social media overall, this was classified as general social media use. Thus, we attempted to apply a consistent process to classification drawing upon the information reported within studies. This was conducted during data extraction by the lead author (AKP) and then reviewed by a second reviewer.

A similar process was applied when classifying the type of health-risk behaviour content (user-generated or marketer-generated content) for those datapoints investigating exposure to health-risk behaviour content on social media. Where the exposure pertained to exposure to advertisements, marketing, or influencer content, marketer-generated content was selected. Where the exposure pertained to user/peer posts displaying risk behaviour content, user-generated content was selected. Where there was insufficient information reported to facilitate accurate classification, both marketer and user-generated content were selected and the datapoint was not used in any subsequent stratified analyses or meta-regression.

We also made efforts to classify reported exposures into those assessing active social media use (online behaviours which facilitate direct exchange among users, e.g., commenting, liking, sending messages and otherwise engaging with other users) and passive use (monitoring of others/content without direct engagement, e.g., browsing/scrolling).⁷

Social media	Definitions	Example platforms
category		
Social media catego	ries outlined in SAGE social media categorisation	
Social networking	Web-based services which facilitate individual construction of a public or	Facebook
sites	semi-public profile within a bounded system, compose a list of other users	Snapchat
	with which they share a connection, and view and traverse their list of	Instagram
	connections as well as those created by others within the system. ⁸	WhatsApp
		Twitter
		LinkedIn
		WeChat
		Chat rooms
		Instant messaging
Microblogging	Services which are centred on short updates which are forwarded to anyone	Twitter
sites	subscribed to receive the updates. ³	Tumblr
Blogs and forums	Online forums which allow forum members to have conversations by posting	LiveJournal
	messages. Blog comments are attached to blogs and usually the discussion is	WordPress
	focussed on the topic of the blog post. ³	
Media-sharing	Services which facilitate uploading and sharing of media including pictures	YouTube
sites	and videos. The majority of services have other social features such as	Pinterest
	profiles, commenting etc. ³	Instagram
		Snapchat
		Facebook
Geo-location-	Services which allow users to connect and exchange messages based on their	Foursquare
based sites	location. ⁹	Tinder
Bookmarking sites	A website which ranks references (bookmarks) to other websites contributed	Delicious
	by users who use the site. Users can add comments to the bookmarks and	StumbleUpon
	make then private or public. The act of bookmarking indicates to others that	Twitter
	an individual is interested in a given resource. ¹⁰	
Social news sites	Services that allow individuals to post news items or links to outside articles	Reddit
	and then facilitates user voting of the items. The voting is the primary social	Digg
	aspect, as items which get the most votes are displayed the most prominently.	
	The community of users decide which news items are seen my more people. ³	
Collaborative	Web-based services which allow users to create content and allow individuals	Wikipedia
authoring sites	with access to the service to modify, edit or review that content. ¹¹	Google Docs
Web conferencing	An umbrella term for types of online collaborative services including web-	Skype
	seminars (webinars), webcasts, and peer-level web meetings. ¹²	Zoom

Table A. Social media categories eligible for inclusion

Scheduling and meeting	Web-based services which facilitate group-based decisions regarding event. ³	Microsoft Outlook Doodle Google Calendar
Additional social m	edia categories eligible for inclusion	
Online gaming (social gaming)	A video game which offers online interactions with other players. ¹³	Multiplayer role-playing games (e.g., World of Warcraft) Social instant games (e.g., Candy Crush)
Online gambling (social gambling)	Any kind of gambling conducted on social media/online platforms, which have varying degrees of social game features ⁴ (not including gambling via internet websites with no social game/social media features). ⁴	Social networking sites real money gambling (e.g., Bingo Appy via Facebook) Simulated gambling via social networking site applications (e.g., City Ville)

Appendix 5. Advisory group

We established an advisory group of experts and policy makers in the field of social media and adolescent health-risk behaviours to provide guidance during protocol development and the review stages. Recruited via expert stakeholders, members included patient/public representatives and stakeholders from policy, non-governmental, and academic sectors (Table A). In line with Grading of Recommendations Assessment, Development, and Evaluation (GRADE) approach,¹⁴ the advisory group members ranked pre-selected outcomes according to their relative importance on a 9-point Likert scale (categories: 1-3 - of limited importance; 4 to 6 -importance; 7 to 9 -critical),¹⁴ completed via an online survey (Table B). The review advisory group members were requested to provide feedback on several factors including the relevance of the review's question, population focus, search strategy, ongoing or published studies, and grey literature selection.¹⁵ Feedback was received during in person meetings, via Zoom or email. During the review stage advisory group members were contacted to identify relevant ongoing, planned, and unpublished studies.

Table A. Advisory group members

Name	Organisation	Period of involvement
Kirsty Blenkins	UK Health Security Agency, Office for Health Improvement	2020 to present
	and Disparities, London, UK	
Lee Craig	Public Health Scotland, Glasgow, UK	2020 to present
Neil Coles	We Are With You, Kent, UK	2020 to February 2021
Nicholas Hickmott	We Are With You, Kent, UK	2020 to present
Professor John Holmes	Alcohol Policy, University of Sheffield, UK	2020 to present
Rachel Macpherson	Scottish Government, Edinburgh, UK	2020 to present
Dr Ross Whitehead	Public Health Scotland, Edinburgh, UK	2020 to July 2021
Dr Richard Purves	University of Stirling, Stirling, UK	2020 to present

Table B. Feedback from advisory group members (online survey)

Rank outcomes according to their relative importance for the scope of the reviews and general public health decision-making in				
the context of social media use ^{a,b}				
Outcome	Mean score	Rank	Rating	
Multiple risk behaviours	7.50	1	Critical	
Alcohol use	7.16	2	Critical	
Drug use	7.00	3	Critical	
Tobacco use	6.50	4	Important	
Use of ENDS	5.83	5	Important	
Sexual risk behaviours	5.60	6	Important	
Gambling	5.16	7	Important	
Antisocial behaviour	5.00	8	Important	
Inadequate physical activity	5.00	8	Important	
Unhealthy dietary behaviours	5.00	8	Important	
How well do the presented outcomes cover the review scope?				
Answers	Rating	Number of re	sponses	
Important outcomes presented	71%	5		
Important outcomes missing	29%	2		
Comments on missing outcomes (2):	(1) Selling and advertising of illicit substances (2) Mental health-related outcomes and bullving			

Legend: ^a 9-point Likert scale (categories: 1 to 3- of limited importance; 4 to 6- important; 7 to 9 – critical). ^b Seven members of the advisory group responded to the survey. Abbreviations: ENDS = Electronic nicotine delivery systems.

Appendix 6. Included outcomes

Outcome	Definition	Illustrative examples
N 12 1 2 1		
behaviours	Two or more of the below outcomes.	Substance use (alcohol, tobacco, and drug use)
Alcohol use	The drinking of beverages containing ethyl alcohol. ¹⁶	Weekly alcohol use Frequency of alcohol use Problem, binge, or hazardous drinking
Drug use	Use of drugs for psychotropic rather than medical purposes, potentially including both legal and illegal substances. ¹⁷	Ever used cannabis Illicit drug use Frequency of drug use
Tobacco use	The practice of smoking tobacco and inhaling tobacco smoke. ¹⁸	Ever smoked a cigarette Frequency of tobacco use
Use of electronic nicotine delivery systems (ENDS)	Umbrella term for vapes, vaporisers, vape pens, e-cigarettes, and e-pipes. ENDS are non-combustible tobacco products which use an e-liquid, containing nicotine. ¹⁹	Ever tried an e-cigarette Frequency of e-cigarette use
Sexual risk behaviour	Initiation of sexual activity at an early age, engaging in unnatural or unprotected sexual intercourse, having sexual intercourse with multiple partners, engaging in paid or irregular or incentive- driven sex or sexual intercourse with an injecting drug user or under the influence (especially intoxication) of psychoactive substances, which may result in sexually transmitted infections, unintended/early pregnancies (or abortions), or legal or interpersonal conflicts. ²⁰	Early age of sexual debut Transactional sex Unprotected sex Sexual intercourse with multiple partners Posting, sharing, or exchanging sexual content using electronic devices
Gambling (not via SM)	Placing something of value (usually but not always money) in hope of acquiring something of greater value. ²¹	Problem gambling Pathological gambling Internet gambling (not via social media)
Unhealthy dietary behaviour	Umbrella term referring to all phenomena related to food choice, eating behaviour, and dietary intake/nutrition. Disordered eating not considered ²²	Low level of fruit and vegetable consumption High fat/sugar/salt diet Low-fibre diet
Inadequate physical activity	Doing no or very little physical activity at work, at home, for transport or in discretionary time. ²³	Physically active for <60 minutes per day on <5 days a week Low levels of physical activity
Anti-social behaviour	Any action which violates social norms in ways which reflect disregard for others, or which reflect the violation of another's rights. ¹⁶	Violence Criminal damage Graffiti/vandalism Aggregated assault Assault with or without injury Stealing/theft Carrying a weapon

Table A. Definitions and illustrative examples of included outcomes

Appendix 7. Meta-analyses and synthesis without meta-analysis (SWiM) decision rules

The below guidance outlines the decision rules used when selecting datapoints/studies for inclusion in metaanalyses and synthesis without meta-analysis (SWiM).

Duplicate studies (i.e., those looking at the same population, exposure combination, outcomes and during overlapping time period)

- Select study with longest follow up period
- If studies have the same follow up period, select largest (or most representative)
- If studies are the same size, choose the most recent

Where a study includes multiple repeat cross-sectional samples, or investigates multiple study populations from different settings, these should be entered as separate datapoints, however, will be classified under the primary study from which they originate.

There may be instances of duplicate datapoints, but if some datapoints are unique (investigate different outcomes) between studies, the overall study should be retained, and individual duplicate datapoints will be removed at the next stage.

Duplicate/overlapping datapoints

Eight options:

- 1. Include in meta-analysis
- 2. Include in stratified analysis (sensitivity/subgroup analysis)
- 3. Include in meta-analysis and stratified analysis
- 4. Include in SWiM
- 5. Include in meta-analysis and SWiM
- 6. Include in stratified analysis and SWiM
- 7. Include in all analyses
- 8. Exclude from all analyses (where sex-stratified datapoints are selected for inclusion and whole sample datapoint is not used)

Selection of datapoints for meta-analysis

- In ensuring independence of data, only one effect size per outcome from each study should be used in each meta-analysis. However, datapoints not included in meta-analyses due to potential double counting of participants may be used within stratified analyses
- Meta-analysis should be performed for each exposure (time spent on social media, frequency of social media use and exposure to health-risk behaviour content on social media), by common metric (standardised beta, standardised mean difference, and odds ratio), and by outcome
- Meta-analysis should be conducted when ≥ 3 datapoints are available for a specific synthesis
- Meta-analyses should be conducted at the datapoint/outcome level, and all forest plots presented should report the risk of bias grade at the datapoint/outcome level

Exposure

Multiple comparison groups:

Select the largest comparator group, unless this would affect the comparability of results within studies, in which case select the most common/unifying comparison group. Where a common/unifying comparison group cannot be identified for a datapoint, report in SWiM.

Same outcome assessed by multiple exposures:

The most used exposure should be selected (i.e., the exposure for which most studies contribute a result). The below criteria should additionally be considered, in order of importance:

- 1. Ways of measuring the same construct: select validated rather than subjective/self-report exposure measure
- 2. Analysis: select exposure pertaining to adjusted estimate (i.e., adjusted for pre-specified critical confounding domains) or estimate which can be meta-analysed

3. Timepoint: select exposure pertaining to datapoint assessing the longest/last occasion measured unless not relevant

Multiple exposure groups from a single datapoint:

Approach taken to overcome a unit of analysis error for a datapoint that could contribute multiple, correlated comparisons, as per Cochrane guidance.²⁴

- 1. Combine exposure groups to create a single pair-wise comparison comparable to other included datapoints in the meta-analysis
- 2. Select one pair of exposure groups and exclude the others, ensuring the groups selected are comparable with other included datapoints in the meta-analysis

Where a second datapoint originating from the same study, with the same exposure, is identified for inclusion in SWiM, the same groups used in the meta-analysis (via selection of one pair of exposure groups/combing exposure groups to create a single pair-wise comparison) should be used to enhance comparability.

Different exposure periods (e.g., past week, current):

Where possible, ensure exposure periods of datapoints to be included in meta-analysis align. Due to heterogeneity of exposures reported across studies, it is anticipated this may not be possible and each meta-analysis will include datapoints with varying exposure periods.

Outcome

If an adjusted datapoint cannot be converted to a common effect, and summary data or an unadjusted datapoint can be converted to a common effect, use this within meta-analysis. If neither the adjusted/unadjusted datapoint or summary data reported by the study can be converted to a common effect (e.g., change scores, outcome trajectory) report using SWiM.

Multiple outcome measures for the same outcome:

Where studies report multiple measures of the same behaviour (e.g., weekly alcohol consumption, frequency of binge drinking) the most common outcome measure should be selected (i.e., the outcome for which most studies contribute a result). The below criteria should additionally be considered, in order of importance:

- 1. Ways of measuring the same construct: select validated rather than subjective/self-report outcome measure
- 2. Analysis: select outcome measure pertaining to adjusted estimate (i.e., adjusted for pre-specified critical confounding domains) or estimate which can be meta-analysed
- 3. Timepoint: select outcome pertaining to datapoint assessing the longest/last occasion measured unless not relevant

Different outcome periods (e.g., past week, past month use):

Where possible, ensure that outcome periods of datapoints to be included in meta-analysis align. Due to heterogeneity of outcomes reported across studies, it is anticipated this may not be possible and each meta-analysis will include datapoints with varying outcome periods.

Varying time points of follow up for an outcome:

- Use the longest time point/last occasion measured unless not relevant (e.g., sexual intercourse measured at Time 1 (study sample aged 15) should be selected instead of sexual intercourse measured at Time 2 (study sample aged 16) where age of consent is 16 years in study setting)
- Where multiple time points are reported, these should be extracted separately, and sensitivity analysis conducted to explore any differences by study design (cross-sectional vs longitudinal)

Sex

- If sex-stratified datapoints reported, use both
- If whole sample estimate (male and female combined) alongside datapoint for a single sex reported, use the whole sample estimate
- If only one datapoint is reported pertaining to a single sex, use this

Selection of datapoints for SWiM (vote counting based on effect direction)

• Where effect estimates are incompletely reported or where study characteristics such as study design, exposures or outcomes are too diverse to provide a meaningful summary effect estimate, report datapoint using SWiM

- Where exposed and unexposed groups reported in a datapoint do not align with the meta-analysis exposed and unexposed group report using SWiM
- Datapoints reporting trajectory of outcome/change in outcome/change scores should not be used in meta-analyses and should be synthesised using SWiM
- Effect direction synthesis should be performed by exposure (time spent on social media, frequency of social media use, exposure to health-risk behaviour content and other social media activities), and by outcome domain
- Where multiple outcome measures are reported for the same exposure and same outcome, the direction of effects reported across outcome measures should be synthesised using the algorithm proposed by Cochrane,^{25,26} based on the proportion of effects which are in a consistent direction. Note it is possible for one study assessing one exposure and one outcome measure to demonstrate an unclear/conflicting/inconsistent effect²⁶
- Where age subsets, study populations from different countries, and repeat cross sectional samples are reported in the same study, these should be entered as separate studies for purposes of SWiM, to maximise use of the available data
- SWiM should be conducted at the study level, and all effect direction plots presented, should report the study risk of bias grade

Exposure

Same outcome assessed by multiple exposures:

The most used exposure selected (i.e., the exposure for which most studies contribute a result). The below criteria will additionally be considered, in order of importance:

- 1. Ways of measuring the same construct: select validated rather than subjective/self-report exposure measure
- 2. Analysis: select exposure pertaining to adjusted estimate (i.e., adjusted for pre-specified critical confounding domains). If all datapoints fail to adjust for pre-specified critical confounders, consider adjustment for other justifiable confounders
- 3. Time point: select exposure pertaining to datapoint assessing the longest/last occasion measured unless not relevant

Multiple exposure groups from a single datapoint:

- Where a datapoint is reported in the meta-analysis and a pairwise comparison is selected/exposure groups are combined, when reporting this datapoint in SWiM ensure the same comparison is used to enhance comparability
- If a datapoint is to be reported in SWiM, and similar datapoints (with the same multiple exposure groups) originating from the same study have not been reported in meta-analyses or SWiM, then select a specific pairwise comparison/combine exposure groups, ensuring efforts are made to maximise use of all data, and the comparison aligns with other datapoints reported in SWiM synthesis

Outcome

Multiple outcome measures reported for the same outcome:

- Where there are multiple outcome measures investigating the same outcome, aggregate these using the effect direction algorithm: report direction of effect where ≥70% of outcomes report similar direction. If <70% of outcomes report consistent direction of effect, then report inconsistent findings²⁶
- The largest sample size across all aggregated datapoints will be reported in the effect direction plot

Multiple time points presented for an outcome from the same study:

- Where there is a cross-sectional and cohort datapoint originating from same study investigating the exact same exposure and outcome, the direction of effect should be aggregated as above. The study design should be reported as a cohort study, and the associated cohort study risk of bias grade reported within the effect direction plot. The sample size reported should reflect that of the sample used in the cohort datapoint
- If datapoints, are reported for different follow up periods (e.g., time 1- time 2 and time 1- time 3) aggregate the direction of effect for all datapoints as above and report the associated risk of bias grade and sample size for the longest follow up period

Sex

If sex-stratified datapoints are reported, aggregate these when reporting effect direction and discard the whole sample estimate.

Appendix 8. Data extraction form exemplar- study and datapoint level variables

Table A. Data extraction form: study level variables

Appendix 9. Newcastle-Ottawa Scale (NOS) risk of bias assessment

For cross-sectional and cohort studies, an adapted version of the Newcastle-Ottawa Scale (NOS) for assessing risk of bias (RoB) in non-randomised studies was used.²⁷ This appendix presents the adapted NOS used when assessing RoB of non-randomised studies and the algorithms used when assessing domain level and overall RoB of included datapoints. To ensure a standardised process to NOS RoB assessment, a detailed guidance document prepared by AKP was circulated to the review team. Those studies reporting baseline data from an interventional study were appraised as per cross-sectional studies. RoB assessment was conducted at the datapoint/outcome level. An overall RoB grade was assigned to each study through consideration of the most commonly reported RoB grade across included datapoints from a study, prioritising the overall grade assigned to datapoints which were investigated via the primary analysis conducted in a study.

Adapted Newcastle Ottawa Scale (NOS): cross-sectional studies

Used when assessing cross-sectional studies, cross-sectional analysis of cohort studies, cross-sectional analysis of intervention studies and repeat cross-sectional studies

Domain A - Selection

Selection - Representativeness of original sample

- a) Good representativeness of the target population (e.g., all subjects, random sampling)
- b) Selection process does not ensure representativeness, but it is clearly described (e.g., non- probability sampling)
- c) Selected group of users, with the potential for selection bias
- d) No description

Selection - Non-respondents

- a) Comparability between respondents and non-respondents' characteristics established and/or response rate ≥75% of original sample and (if applicable) those with and without missing data established and adjusted for
- b) Comparability between respondents and non-respondents is unsatisfactory or response rate <75% or (if applicable) missing data addressed inappropriately
- c) No description or unclear

Figure A. Algorithm to assess the <u>Selection</u> domain of the adapted Newcastle Ottawa Scale for crosssectional studies

Domain B - Exposure

Exposure - Ascertainment of exposure

- a) Objectively recorded social media usage data, independent of user reports
- b) Validated measurement tool
- c) Non-validated measurement tool, but the tool is available or described
- d) No description or unclear

Figure B. Algorithm to assess the <u>Exposure</u> domain of the adapted Newcastle Ottawa Scale for crosssectional studies

Domain C - Comparability

Comparability - Based on analysis of interest. Confounding factors are controlled.

- (a) The study controls for <u>key confounders</u> age, sex/gender, and socioeconomic position (e.g., parental educational attainment, employment, income, area-level deprivation)
- (b) The study controls for <u>key confounders</u> age, sex/gender, and socioeconomic position (e.g., parental educational attainment, employment, income, area-level deprivation) **and** the study controls for an alternative set of justifiable confounders (e.g., sensation seeking, peer influence or proxy measures for age, sex/gender, or socioeconomic position)
- (c) The study controls for an alternative set of justifiable confounders (e.g., sensation seeking, peer influence or proxy measures for age, sex/gender, or socioeconomic position)
- (d) No adjustment for potential confounders, no description or unclear

Figure C. Algorithm to assess the <u>Comparability</u> domain of the adapted Newcastle Ottawa Scale for cross-sectional studies

Domain D - Outcome

Outcome- Assessment of outcome

- (a) Independent clinical assessment or validated measurement tool
- (b) Medical/administrative records
- (c) Self-report
- (d) No description, or other inadequate

Figure D. Algorithm to assess the <u>Outcome</u> domain of the adapted Newcastle Ottawa Scale for crosssectional studies

Adapted Newcastle Ottawa Scale (NOS): cohort studies

Used when assessing cohort and panel studies

Domain A - Selection

Selection - Representativeness of the original sample

- a) Good representativeness of the target population (e.g., all subjects, random sampling)
- b) Selection process does not ensure representativeness, but it is clearly described (e.g., non- probability sampling)
- c) Selected group of users, with the potential for selection bias
- d) No description

Selection - Selection of the comparator group

- a) Drawn from the same community as the exposed cohort
- b) Drawn from a different source
- c) No description of the derivation of the non-exposed cohort

Figure E. Algorithm to assess the <u>Selection</u> domain of the adapted Newcastle Ottawa Scale for cohort studies

Domain B - Exposure

Exposure - Ascertainment of exposure

- a) Objectively recorded social media usage data, independent of user reports
- b) Validated measurement tool
- c) Non-validated measurement tool, but the tool is available or described
- d) No description or unclear

Figure F. Algorithm to assess the <u>Exposure</u> domain of the adapted Newcastle Ottawa Scale for cohort studies

Domain C - Comparability

Comparability - Based on analysis of interest. Confounding factors are controlled.

- a) The study controls for <u>key confounders</u> age, sex/gender, and socioeconomic position (e.g., parental educational attainment, employment, income, area-level deprivation)
- b) The study controls for <u>key confounders</u> age, sex/gender, and socioeconomic position (e.g., parental educational attainment, employment, income, area-level deprivation) **and** the study controls for an alternative set of justifiable confounders (e.g., sensation seeking, peer influence or proxy measures for age, sex/gender, or socioeconomic position)
- c) The study controls for an alternative set of justifiable confounders (e.g., sensation seeking, peer influence or proxy measures for age, sex/gender, or socioeconomic position)
- d) No adjustment for potential confounders, no description or unclear

Comparability - Accounts for baseline measure of outcome

- a) Yes
- b) No

Figure G. Algorithm to assess the <u>Comparability</u> domain of the adapted Newcastle Ottawa Scale for cohort studies

Domain D - Outcome

Outcome - Assessment of outcome

- (a) Independent clinical assessment or validated measurement tool
- (b) Medical/administrative records
- (c) Self-report
- (d) No description, or other inadequate

Outcome - Adequacy of follow up

- a) Complete follow up (on all relevant variables)- all subjects accounted for
- b) Subjects lost to follow up or due to missing data <25%, unlikely to introduce bias, or accounted for using weights, imputation etc.
- c) Loss to follow up substantial ($\geq 25\%$) and/or likely to introduce bias
- d) Not described or unclear

Figure H. Algorithm to assess the <u>Outcome</u> domain of the adapted Newcastle Ottawa Scale for cohort studies

Assessing domain level and overall risk of bias (RoB) for included datapoints

For both cross-sectional studies and cohort studies, the algorithms presented above were used to grade each domain using the response options selected for each signalling question. Each domain was allocated either a low, moderate, or high RoB grade as illustrated in Table A.

Domain	Risk of bias judgement		
Selection	Low risk of bias	Moderate risk of bias	High risk of bias
Exposure	Low risk of bias	Moderate risk of bias	High risk of bias
Comparability	Low risk of bias	Moderate risk of bias	High risk of bias
Outcome	Low risk of bias	Moderate risk of bias	High risk of bias

Once all domains were graded, Table B was used to reach an <u>overall RoB judgement for each datapoint</u> using the grades applied for each domain.

Table B. Algorithm to classify overall risk of bias (RoB) grade

Overall risk of bias judgement	Criteria
Low risk of bias	Study is not judged to be at high risk of bias for any domain and is judged to be at low risk of bias
	for either the Exposure or Comparability domain
Moderate risk of bias	Study does not meet criteria for either High risk of bias or Low risk of bias
High risk of bias	Study is judged to be at high risk of bias in <u>at least one domain</u>

Appendix 10. Process for data transformations for meta-analysis

Data transformations were conducted according to guidance within the Cochrane Handbook,^{28,29} and using the Campbell Collaboration online effect size calculator.³⁰

Since most reported outcomes for binary exposures were binary, statistical approaches were conducted to reexpress continuous outcome data as odds ratios (ORs) as per the Cochrane Handbook, thus allowing binary and continuous outcome data to be combined.^{28–31} For continuous outcomes, data were pooled to produce standardised beta coefficients (Std. Beta) or standardised mean differences (SMDs).^{28–31} For continuous exposures - which are infrequently reported in systematic reviews, meaning best practice recommendations are not available within the Cochrane Handbook,²⁹ and the difficulties in interpretation of such a synthesis, we opted not to combine continuous and binary outcome data. Instead, continuous exposure and continuous outcomes were pooled separately as standardised beta coefficients or standardised mean differences (SMDs).^{28–31} Continuous exposure and binary outcomes were pooled separately as ORs.

Beta coefficients were converted to standardised beta coefficients. Pearson correlation coefficients were converted to standardised mean differences adopting the method outlined by Mathur and VanderWeele.² Here, where studies failed to report the standard deviation (SD) of the exposure, efforts were made to contact study authors to obtain the information required for transformation. Where this was not possible, as recommended a substitute estimate was extracted from a second comparable included study (n = 1) or subsample of the study used to estimate *r* and the N term within the formula replaced with the size of the second sample used to estimate the exposure SD.²

Presenting multiple exposure groups for one study (for example, if there was a shared reference group) means that multiple, correlated comparisons would result and therefore standard errors could be underestimated. Efforts were therefore made to combine groups to create a single pairwise comparison as recommended by Cochrane.²⁴ This was only possible when included studies reported the required raw data (e.g., sample sizes, number of participants with the outcome in each exposure group) for all exposure groups. Where this was not possible one pair of exposure groups was selected and the others excluded. Groups were combined/selected ensuring comparability with other included datapoints within the meta-analysis, as per the meta-analysis decision rules presented in Appendix 7. For subgroup analysis, in some instances the analysis includes datapoints not used within primary meta-analysis due to potential double counting of study participants. For example, where multiple datapoints were reported within the same study assessing different social media categories/platforms/content, they were included within separate subgroups.

As per the Cochrane Handbook, where studies reported a p value of <0.05 in the absence of the exact value and this was required to determine the standard error of an estimate, to facilitate inclusion in the meta-analysis, the p-value was assumed to be 0.05.²⁸ Where data were insufficiently reported for standardisation or transformation, study investigators were contacted by email (n= 6 responses received).

Appendix 11. Characteristics of included studies

 Table A. Characteristics of included studies (n=126 studies; 338 datapoints)

Author and year	Study design	Study period	Country	Equity	Participants	Mean age [range]	Risk of bias	N°. of dp	MA?	Exposure	Exposure measure	Outcome measure	N

											information)		

Legend: Where exposure ascertainment was via objectively recorded social media usage data, independent of user reports or via a validated measurement tool, this is stated in italics; where outcome ascertainment was via independent clinical assessment, a validated tool, or medical/administrative records, this is stated in italics. All other measures are self-report. An adapted Newcastle Ottawa Scale (NOS) was used to assess risk of bias for cross-sectional and cohort studies and the Cochrane risk of bias 2 tool for randomised trials (RoB-2) was used for randomised control trial studies. All included studies were assessed using synthesis without meta-analysis (SWiM), excluding one study⁷⁴ which was included due to potential double counting of study participants; we were however able to include estimates from this studies in meta-analysis stratified by outcome where this issue did not occur. Abbreviations: ADHD = Attention deficit hyperactivity disorder; ASA24 = Dietary Assessment Tool; AUDIT/C = Alcohol Use Disorders Identification Test; CAGI/GPSS = Gambling Problem Severity Subscale of the Canadian Adolescent Gambling Index; dp = number of datapoints; DSM-IV-MR-J = Diagnostic and Statistical Manual of Mental Disorders-IV-Multiple Response- Adapted for Juveniles (assessment of adolescent gambling); ESP = Spain; FIN = Finland; Freq = Frequency; HEI = Healthy Eating Index; KOR = South Kore; MA = Study included in meta-analysis, subgroup or sensitivity analysis; Mod = Moderate RoB; N = Number of study participants; RS = Net reported; PAQ-C/A = Physical Activity Questionnaire for Children and Adolescent; ROG = Repeat cross-sectional study; RCT = Randomised control trial; RoB-2 = Cochrane risk of bias 2 tool for randomised trials; SBS = Sexting Behaviour Scale; SDQ = Strengths and Difficulties Questionnaire; SEP = Socioeconomic position; SOGS-RA = South Oaks Gambling Screen-Revised for Adolescents; T = Timepoint; UK = United Kingdom; USA = United States; WHO = World Health Organisation; YSR = Youth Self-Report; and

Appendix 12. Characteristics of excluded studies

Table A. List of studies excluded at full text screening (n=571 studies) with reasons for exclusion

Author and year	Title	Publication source	Reason for exclusion
Abara 2014	Understanding internet sex-seeking behaviour and sexual risk among young men who have sex with men: evidence from a cross-sectional study.	Sexually Transmitted Infections	Incorrect population
Abdi 2015	Personal, social, and environmental risk factors of problematic gambling among high school adolescents in Addis Ababa, Ethiopia	Journal of Gambling Studies	Incorrect exposure
Abed-Ali 2018	Violence among high school female students in Baghdad city	Indian Journal of Public Health Research and Development	Incorrect exposure
Acar 2020	Eating attitudes and physical appearance comparison with others in daily life versus on social media in adolescents	Journal of Adolescent Health	Incorrect study type: conference proceeding or abstract
Adam 2011	When do online sexual fantasies become reality? The contribution of erotic chatting via the Internet to sexual risk-taking in gay and other men who have sex with men.	Health Education Research	Incorrect exposure
Adams 2010	Correlates of physical activity in young American Indian children: lessons learned from the Wisconsin Nutrition and Growth Study	Journal of Public Health Management and Practice	Incorrect exposure
Adams 2019	Predictors of overweight and obesity in American Indian families with young children	Journal of Nutrition Education and Behaviour	Incorrect exposure
Adebayo 2006	Gender, internet use, and sexual behaviour orientation among young Nigerians	Cyberpsychology and Behaviour	Incorrect exposure
Afolabi 2015	Media exposure and weight concern?	Child and Adolescent Health Issues	Incorrect study type: commentary/editorial/non- systematic review/theses/book chapter(s)
Agaku 2014	Trends in exposure to pro-tobacco advertisements over the Internet, in newspapers/magazines, and at retail stores among U.S. middle and high school students, 2000-2012	Preventive Medicine	Incorrect exposure
Aggio 2012	Temporal relationships between screen-time and physical activity with cardiorespiratory fitness in English schoolchildren: a 2-year longitudinal study.	Preventive Medicine	Incorrect exposure
Agurcia-Parker 2009	An investigation into the relationship between screen time, consumption of advertised foods, and physical activity among Texas 4th grade elementary school children	Dissertation Abstracts International: Section B: The Sciences and Engineering	Incorrect study type: commentary/editorial/non- systematic review/theses/book chapter(s)
Ahern 2015	Risky behaviours and social networking sites	Journal of Psychosocial Nursing & Mental Health Services	Incorrect study type: commentary/editorial/non- systematic review/theses/book chapter(s)
Aires 2010	A 3-year longitudinal analysis of changes in fitness, physical activity, fatness, and screen time	Acta Paediatrica, International Journal of Paediatrics	Incorrect exposure
Aires 2010	A 3-year longitudinal analysis of changes in Body Mass Index	International Journal of Sports Medicine	Incorrect exposure

Author and year	Title	Publication source	Reason for exclusion
Al-Ajlouni 2018	Partner meeting venue typology and sexual risk behaviours among French men who have sex with men.	International Journal of STD & AIDS	Incorrect exposure
Albert 2018	#consumingitall: Understanding the complex relationship between media consumption and eating behaviours	Dissertation Abstracts International: Section B: The Sciences and Engineering	Incorrect study type: commentary/editorial/non- systematic review/theses/book chapter(s)
Albury 2018	Young people, digital media research and counter public sexual health	Sexualities	Incorrect study type: commentary/editorial/non- systematic review/theses/book chapter(s)
Alghadir 2020	Differences among Saudi and expatriate students: Body composition indices, sitting time associated with media use and physical activity pattern	International Journal of Environmental Research and Public Health	Incorrect exposure
Alhabash 2021	Trick or drink: offline and social media hierarchical normative influences on Halloween celebration drinking	Health Communication	Incorrect population
Al-Hamdani 2021	Perceptions and experiences of vaping among youth and young adult e-cigarette users: considering age, gender, and tobacco use	Journal of Adolescent Health	Incorrect population
Al-Hamdani 2022	Do perceptions and experiences of vaping among youth and young adults differ by device type?	Addiction Research & Theory	No relevant outcome(s)
Al-Hazzaa 2011	Physical activity, sedentary behaviours, and dietary habits among Saudi adolescents relative to age, gender, and region	The International Journal of Behavioural Nutrition and Physical Activity	Incorrect exposure
Al-Hazzaa 2019	Activity energy expenditure, screen time and dietary habits relative to gender among Saudi youth: interactions of gender with obesity status and selected lifestyle behaviours	Asia Pacific Journal of Clinical Nutrition	Incorrect exposure
Alhusaini 2020	Cross-cultural variation in BMI, sedentary behaviour, and physical activity in international schoolgirls residing in Saudi Arabia	International Journal of Environmental Research and Public Health	Incorrect exposure
Allen 2017	Mobile phone and internet use mostly for sex-seeking and associations with sexually transmitted infections and sample characteristics among black/African American and Hispanic/Latino men who have sex with men in 3 US cities	Sexually Transmitted Diseases	Incorrect population
Allen 2018	The dirt on clean eating: a cross sectional analysis of dietary intake, restrained eating, and opinions about clean eating among women.	Nutrients	Incorrect population
Allender 2011	Associations between activity-related behaviours and standardized BMI among Australian adolescents	Journal of Science and Medicine in Sport	Incorrect exposure
Alosaimi 2016	Smartphone addiction among university students in Riyadh, Saudi Arabia.	Saudi Medical Journal	Incorrect population

Author and year	Title	Publication source	Reason for exclusion
Altenburg 2012	Direction of the association between body fatness and self-reported screen time in Dutch adolescents	International Journal of Behavioural Nutrition and Physical Activity	Incorrect exposure
Altenburg 2017	Actual and perceived weight status and its association with slimming and energy-balance related behaviours in 10- to 12-year-old European children: the ENERGY-project	Paediatric Obesity	Incorrect exposure
Alvarez-Jimenez 2019	HORYZONS trial: Protocol for a randomised controlled trial of a moderated online social therapy to maintain treatment effects from first-episode psychosis services	BMJ Open	Incorrect study type: commentary/editorial/non- systematic review/theses/book chapter(s)
Ammouri 2004	Correlates of exercise participation in adolescents	Correlates of Exercise Participation in Adolescents	Incorrect exposure
Amornsriwata-nakul 2017	Are Thai children and youth sufficiently active? Prevalence and correlates of physical activity from a nationally representative cross-sectional study	International Journal of Behavioural Nutrition and Physical Activity	Incorrect exposure
Andrie 2019	Gambling involvement and problem gambling correlates among European adolescents: results from the European Network for Addictive Behaviour study.	Social Psychiatry and Psychiatric Epidemiology	Incorrect exposure
Arie 2014	Doctors and teachers receive new guidance on the internet's effect on young people's sex lives and relationships	BMJ	Incorrect study type: commentary/editorial/non- systematic review/theses/book chapter(s)
Armstrong 2018	An exploration of how simulated gambling games may promote gambling with money	Journal of Gambling Studies	Incorrect study type: commentary/editorial/non- systematic review/theses/book chapter(s)
Arriscado 2014	Factors associated with low adherence to a Mediterranean diet in healthy children in northern Spain	Appetite	Incorrect exposure
Arsad 2021	A systematic review of immersive social media activities and risk factors for sexual boundary violations among adolescents	IUM Medical Journal Malaysia	Incorrect study type: systematic review
Arseniev-Koehler 2014	Peer influence on undergraduates' intention to get drunk by communication formats	Alcoholism: Clinical and Experimental Research	Incorrect study type: conference proceeding or abstract
Asad 2015	Screen-based behaviours of adolescents in Bangladesh	European Journal of Epidemiology	Incorrect exposure
Aschbrenner 2019	Randomized trial of a lifestyle intervention for young adults with serious mental illness in community mental health centres	Schizophrenia Bulletin	Incorrect study type: conference proceeding or abstract
Ashford 2017	Advertising exposure and use of e-cigarettes among female current and former tobacco users of childbearing age	Public Health Nursing	Incorrect population

Author and year	Title	Publication source	Reason for exclusion
Asut 2019	Relationships between screen time, internet addiction and other lifestyle behaviours with obesity among secondary school students in the Turkish Republic of Northern Cyprus	Turkish Journal of Paediatrics	Incorrect exposure
Athauda 2020	Factors influencing alcohol use among adolescents in South Asia: a systematic review	Journal of Studies on Alcohol and Drugs	Incorrect study type: systematic review
Atkin 2013	Determinants of change in children's sedentary time	Plos One	Incorrect exposure
Atkin 2021	Adolescent time use and mental health: a cross-sectional, compositional analysis in the Millennium Cohort Study	BMJ Open	Incorrect exposure
Atkinson 2010	Online behaviours of adolescents: victims, perpetrators, and Web 2.0.	Journal of Sexual Aggression	Incorrect study type: commentary/editorial/non- systematic review/theses/book chapter(s)

Appendix 14. Social media measures reported in included studies

Table A below outlines the social media exposure measures (n=253) used to assess social media use across included studies. Within included studies, many social media exposure measures were reported and were incorporated in our exploration of how SM use is measured in relation to adolescent health-risk behaviours, therefore the number of datapoints reported differ from those included in the review synthesis. Please also note this table records the exposure measures in their original form as reported in included studies, in some instances the exposure measures may have been transformed/specific pairwise comparisons selected for inclusion in meta-analyses/SWiM as per the decisions rules outlined in Appendix 7. The final three columns, titled 'SM platform', 'SM category (active/passive use)' and 'SM content', used information from included studies to categorise the social media platform, category and content type under study. The categorisation was conducted using the 'Process of social media categorisation' presented in Appendix 4.

Exposure	Author and year	Exposure definition	Exposure ascertainment	Validated/ objectively recorded	Exposure measure type	Exposure time period	SM platform	SM platform	SM category (active/ passive use)	SM content
Time Spent on SM	Brunborg 2019	Change in hrs of SM use per day (∆ = T2 – T1)	Self-report 2-item measure: 1-Frequency of SM use in the past 6/12 months. Participant asked to report on active SM use: reading, writing, watching pictures, making comments, or appointments on SM etc, and not merely the time logged on. Responses: every day to not at all. Responses recoded into the average number of days per month spent on SM. 2-How many hrs/day usually spent on SM. Responses: < 1 hr to >15 hrs/day in hourly increments. Product of frequency (average days/month) and quantity (average hrs/day) divided by 30 to reflect the average number of hrs spent on SM per day.		Continuous	T1: past 12 months T2: past 6 months	Examples: Facebook, Snapchat, WhatsApp, Twitter, Instagram, and Kik	Mixed platforms	SNS (active use)	NA
Time Spent on SM	Brunborg 2019	Average number of hrs spent on SM per day	 <u>Self-report 2-item measure:</u> 1-Frequency of SM use in the past 6/12 months. Respondents asked to report on active SM use: reading, writing, watching pictures, making comments, or appointments on SM etc, and not merely the time logged on. Responses: every day to not at all. Responses recoded into the average number of days per month spent on SM. 2-How many hrs per day usually spent on SM. Responses: <1 hr to >15 hrs/day in hourly increments. Product of frequency (average days/month) and quantity (average hrs/day) divided by 30 to reflect the average number of hrs spent on SM per day. 		Continuous	Past 12 months	Examples: Facebook, Snapchat, WhatsApp, Twitter, Instagram, and Kik	Mixed platforms	SNS (active use)	NA

Appendix 16. Synthesis without meta-analysis (SWiM), meta-analyses, meta-regression, subgroup, and sensitivity analyses

Alcohol use

Effect direction plot

Figure A demonstrates the effect direction in those studies investigating alcohol use, by exposure. Six studies investigated more than one exposure. 56,87,90,114,119,138 For time spent on social media, 15/16 studies (93.8%) reported harmful associations (95% CI 71.7 to 98.9%; participant n=100,354; sign test p < 0.001), 16/17 studies (94.1%) reported harmful associations for frequency of social media use (73.0 to 99.0%; participant n=390,843; sign test p < 0.001), and 11/12 studies (91.7%) reported harmful associations for exposure to health-risk behaviour content on social media (64.6 to 98.5%; participant n=24,247; sign test p=0.006). Other social media activities was investigated by one study which demonstrated a harmful association (20.7 to 100%; participant n=4,485; insufficient data to conduct sign test).

Figure A. Effect direction plot for studies of the association between social media use and adolescent alcohol use, by social media exposure. Arrow size indicates sample size; arrow colour indicates study risk of bias.

Drug use

Effect direction plot

Figure W demonstrates the effect direction in those studies (n=13) investigating drug use, by exposure. Two studies investigated more than one exposure.^{124,153} For time spent on social media, 5/6 studies (83.3%) reported harmful associations (95% CI 43.6 to 97.0%; participant n=727,788; sign test p=0.22). For frequency of social media use 5/6 studies (83.3%) demonstrated harmful associations (43.6 to 97.0%; participant n=117,645; sign test p=0.22) and for exposure to health-risk behaviour content on social media all studies demonstrated harmful associations (34.2 to 100.0%; study n=2; participant n=1,268; insufficient data to conduct sign test). Other social media activities was investigated by one study which demonstrated a harmful association (20.7 to 100.0%; participant n=786; insufficient data to conduct sign test).

Figure W. Effect direction plot for studies of the association between social media use and adolescent drug use, by social media exposure. Arrow size indicates sample size; arrow colour indicates study risk of bias.

Legend: Sample size: represented by the size of the arrow, measured on a log scale. Outcome measure: number of outcome measures synthesised within each study. Studies organised by risk of bias grade, study design, and year of publication. Repeat cross-sectional studies, multiple study populations from different countries, and age subsets originating from the same study reported as separate studies. Abbreviations: NOS = Assessed via adapted Newcastle Ottawa Scale; and SM = Social media.

Tobacco use

Effect direction plot

Figure AD illustrates the effect direction in those studies investigating tobacco use, by exposure. One study investigated more than one exposure.⁸⁷ For time spent on social media all studies demonstrated harmful associations of social media use (95% CI 43.9 to 100%; study n=3; participant n=7216; sign test p=0.25), as did all studies investigating exposure to health-risk behaviour content (51.0 to 100%; study n = 4; participant n=24,197; sign test p=0.13). For frequency of social media use 9/10 studies (90.0%) demonstrated harmful associations (59.6 to 98.2%; participant n=431,501; sign test p=0.02). Other social media activities was investigated by one study which demonstrated a harmful association (0.00 to 79.3%; participant n=5,851; insufficient data to conduct sign test).

Figure AD. Effect direction plot for studies of the association between social media use and adolescent tobacco use, by social media exposure. Arrow size indicates sample size; arrow colour indicates study risk of bias.

Use of electronic nicotine delivery systems (ENDS)

Effect direction plot

Figure AL demonstrates the effect direction in those studies (n=9) investigating use of electronic nicotine delivery systems (ENDS), by exposure. For time spent on social media, all studies reported harmful associations (95% CI 34.2 to 100.0%; study n=2; participant n=9,821; insufficient data to conduct sign test), for frequency of social media use, 2/3 studies (66.7%) demonstrated harmful associations (20.8 to 93.9%; participant n=18,047; sign test p=1.00) and for exposure to health-risk behaviour content on social media all studies reported harmful effects (51.0 to 100.0%; study n=4; participant n=721,322; sign test p=1.00).

Figure AL. Effect direction plot for studies of the association between social media and adolescent use of electronic nicotine delivery systems, by social media exposure. Arrow size indicates sample size; arrow colour indicates study risk of bias.

Legend: Sample size: represented by the size of the arrow, measured on a log scale. Outcome measure: number of outcome measures synthesised within each study. Studies organised by risk of bias grade, study design, and year of publication. Repeat cross-sectional studies, multiple study populations from different countries, and age subsets originating from the same study reported as separate studies. Abbreviations: NOS = Assessed via adapted Newcastle Ottawa Scale; and SM = Social media.

Sexual risk behaviour

Effect direction plot

Figure AP demonstrates the effect direction in those studies investigating sexual risk behaviour, by exposure. Six studies investigated more than one exposure type. 60,90,98,115,150,113 After excluding one study with inconsistent findings (participant n=333),¹²⁵ for time spent on social media, 5/6 studies (83.3%) reported harmful associations (95% CI 43.6 to 97.0%; participant n=13,528; sign test p=0.22), 17/18 studies (94.5%) reported harmful associations for frequency of social media use (74.2 to 99.0%; participant n=53,433; sign test p < 0.001), all studies reported harmful associations for exposure to health-risk behaviour content on social media (34.2 to 100.0%; study n=2; participant n=138; insufficient data to conduct sign test), and 4/5 studies (80.0%) reported harmful associations of engagement in other social media activities (37.6 to 96.4%; participant n=6,141; sign test p=0.38).

Figure AP. Effect direction plot for studies of the association between social media use and adolescent engagement in sexual risk behaviour, by social media exposure. Arrow size indicates sample size; arrow colour indicates study risk of bias.

Gambling

Effect direction plot

Figure BA shows the effect direction in those studies investigating gambling behaviour, by exposure. After excluding one study demonstrating inconsistent effects (participant n=14,478),⁴⁶ for frequency of social media use all studies reported harmful associations (95% CI 56.6 to 100.0%; study n=5; participant n=7,928; sign test p=0.06). Other social media activities was investigated by one study which demonstrated a harmful association on gambling behaviours (20.7 to 100.0%; participant n=3,772; insufficient data to conduct sign test).

Figure BA. Effect direction plot for studies of the association between social media use and adolescent gambling, by social media exposure. Arrow size indicates sample size; arrow colour indicates study risk of bias

Legend: Sample size: represented by the size of the arrow, measured on a log scale. Outcome measure: number of outcome measures synthesised within each study. Studies organised by risk of bias grade, study design, and year of publication. Repeat cross-sectional studies, multiple study populations from different countries, and age subsets originating from the same study reported as separate studies. Abbreviations: NOS = Assessed via adapted Newcastle Ottawa Scale; and SM = Social media.

Anti-social behaviour

Effect direction plot

Figure BE demonstrates the effect direction in those studies investigating anti-social risk behaviour, by exposure. One study investigated more than one exposure type.⁵²Across all investigated exposures, all studies demonstrated harmful associations of social media use (time spent on social media: 95% CI 61.0 to 100.0%, study n=6, participant n=51,611, sign test p=0.03; frequency of social media use: 64.6 to 100.0%, study n=7, participant n=56,918, sign test p=0.02; and exposure to health-risk behaviour content on social media: 34.2 to 100.0%, study n=2, participant n=1,372, insufficient data to conduct sign test). Other social media activities was investigated by one study, which demonstrated a harmful effect (20.7 to 100.0%; participant n=1,167; insufficient data to conduct sign test.

Figure BE. Effect direction plot for studies of the association between social media use and adolescent engagement in anti-social behaviour, by social media exposure. Arrow size indicates sample size; arrow colour indicates study risk of bias.

Inadequate physical activity

Effect direction plot

Figure BK demonstrates the effect direction in those studies (n=14) investigating inadequate physical activity, by exposure. After excluding those with inconsistent findings (n=3),^{112,137,95} for time spent on social media, 4/8 of studies reported harmful associations (95% CI 21.5 to 78.5%; participant n = 52,475; sign test p=1.00), whilst for frequency of social media use no study reported a harmful association (0.00 to 56.1%; study n=3; participant n=57,953; sign test p=0.25).

Figure BK. Effect direction plot for studies of the association between social media use and adolescent inadequate physical activity, by social media exposure. Arrow size indicates sample size; arrow colour indicates study risk of bias.

Legend: Sample size: represented by the size of the arrow, measured on a log scale. Outcome measure: number of outcome measures synthesised within each study. Studies organised by risk of bias grade, study design, and year of publication. Repeat cross-sectional studies, multiple study populations from different countries, and age subsets originating from the same study reported as separate studies. Shimoga 2019 assessed frequency of social media use and one outcome (physical activity) across three subgroups. Two of the three subgroups showed increased frequency of social media resulted in decreased physical activity, and one subgroup showed increased frequency of social media resulted in increased physical activity, thus this study was classified as demonstrating inconsistent findings. Abbreviations: NOS = Assessed via adapted Newcastle Ottawa Scale and SM = Social media.

Unhealthy dietary behaviour

Effect direction plot

Figure BP demonstrate the effect direction in those studies investigating unhealthy dietary behaviours, by exposure. Two studies investigated more than one exposure.^{34,161} For time spent on social media and frequency of social media use, all studies reported harmful associations (time spent on social media: 95% CI 51.0 to 100.0%, study n=4, participant n=12,006, sign test p=0.13; frequency of social media use: 34.2 to 100.0%, study n=2, participant n = 826, insufficient data to conduct sign test). The relationship between exposure to health-risk behaviour content on social media and unhealthy dietary behaviours was investigated by four RCT's (two rated low risk of bias (RoB) and two rated some concerns, via the Cochrane RoB-2 Tool), and three cross-sectional studies (two rated low RoB and one moderate). Considering all seven studies together, all studies reported harmful associations of social media (64.6 to 100.0%; study n=7; participant n=10,648; sign test p=0.02). When differentiating by study design, all RCT's reported harmful effects (51.0 to 100.0%; study n=4; participant n=521; sign test p=0.13) and all cross-sectional studies reported harmful associations (43.9 to 100.0%; study n=3; participant n=10,127; sign test p=0.25).

Figure BP. Effect direction plot for studies of the association between social media use and adolescent unhealthy dietary behaviour, by social media exposure. Arrow size indicates sample size; arrow colour indicates study risk of bias.

Legend: Sample size: represented by the size of the arrow, measured on a log scale. Outcome measure: number of outcome measures synthesised within each study. Studies organised by risk of bias grade, study design, and year of publication. Repeat cross-sectional studies, multiple study populations from different countries, and age subsets originating from the same study reported as separate studies. Abbreviations: NOS = Assessed via adapted Newcastle Ottawa Scale; RCT = Randomised Control Trial; RoB-2 = Assessed via Cochrane Risk of Bias 2 Tool; and SM = Social media.

Multiple risk behaviours

Effect direction plot

Figure BS demonstrates the effect direction in those studies (n=9) investigating multiple risk behaviours, by exposure. One study investigated more than one exposure type.¹¹⁵ For time spent on social media, the one study investigated reported a harmful association (95% CI 20.7 to 100.0%; participant n=500; insufficient data to conduct sign test), for frequency of social media use all studies demonstrated harmful associations (51.0 to 100.0%; study n=4; participant n=44,271; sign test p=0.13). Similarly, for exposure to health-risk behaviour content on social media, all studies demonstrated harmful associations (43.9 to 100.0%; study n=3; participant n=16,110,555; sign test p=0.25) and for other social media activities, the one study investigated reported a harmful association (20.7 to 100.0%; participant n=716; insufficient data to conduct sign test).

Figure BS. Effect direction plot for studies of the association between social media use and adolescent engagement in multiple risk behaviours, by social media exposure. Arrow size indicates sample size; arrow colour indicates study risk of bias.

Legend: Sample size: represented by the size of the arrow, measured on a log scale. Outcome measure: number of outcome measures synthesised within each study. Studies organised by risk of bias grade, study design, and year of publication. Repeat cross-sectional studies, multiple study populations from different countries, and age subsets originating from the same study reported as separate studies. Abbreviations: NOS = Assessed via adapted Newcastle Ottawa Scale; and SM = Social media.

Appendix 18. Summary of findings and certainty of evidence

Table A. Summary of findings and certainty of evidence for seven priority outcomes (as per GRADE) with reasons for upgrading/downgrading of the evidence

Population/setting: Adolescents aged 10-19 years in high and low-middle income settings Intervention: Frequent social media use Comparison: Infrequent social media use								
Outcome	Anticipated absolute effe	cts ^a (95% CI)	Relative effect	No. of	Certainty of	Comments		
	Risk with infrequent social media use	Risk with frequent social media use	(95% CI)	(studies)	the evidence (GRADE)			
Alcohol use	48.9% of participants in the control group used alcohol	58.6% of exposed group participants used alcohol (56.4 to 60.8%)	OR 1.48 (1.35 to 1.62)	383,068 (9 observational studies)	$ \bigoplus_{a,b,c,d,e} \bigoplus \bigoplus $	Frequent social media use increases adolescent alcohol use. Absolute effect calculated from Riehm 2021. ¹²³		
Drug use	17.0% of participants in the control group used drugs	20.8% of exposed group participants used drugs (17.7 to 24.2%)	OR 1.28 (1.05 to 1.56)	117,645 (6 observational studies)	⊕⊖⊝⊖ Very low	Downgraded for RoB. Frequent social media use may increase adolescent drug use. Absolute effect calculated from Whitehill 2020. ¹⁵³		
Tobacco use	12.1% of participants in the control group used tobacco	20.3% of exposed group participants used tobacco (17.0 to 24.0%)	OR 1.85 (1.49 to 2.30)	424,326 (8 observational studies)	⊕⊖⊖⊖ Very low	Downgraded for RoB and inconsistency. Frequent social media use may increase adolescent tobacco use. Absolute effect calculated from Vazquez-Nava 2020. ¹⁴⁹		
Electronic nicotine delivery system use	66.7% of studies demonstr adolescent use of electroni	a use on I 20.8 to 93.9%)	18,047 (3 observational studies)	⊕⊕⊝⊝ Very low	Downgraded for RoB and imprecision. Frequent social media use may increase adolescent use of ENDS.			
Sexual risk behaviour	37.0% of participants in the control group engaged in sexual risk behaviours	50.9% of exposed group participants engaged in sexual risk behaviours (46.5 to 55.4%)	OR 1.77 (1.48 to 2.12)	47,280 (10 observational studies)	⊕⊖⊖⊖ Very low ^{n,o,p,q,r}	Downgraded for RoB and publication bias. Frequent social media use may increase in adolescent sexual risk behaviours. Absolute effect calculated from Self-Brown 2018 . ¹³⁴		
Gambling	21.4% of participants in the control group engaged in gambling	43.6% of exposed group participants engaged in gambling (35.7 to 52.0%)	OR 2.84 (2.04 to 3.97)	26,537 (5 observational studies)	⊕⊖⊖⊖ Very low	Downgraded for RoB. Frequent social media use may increase adolescent gambling. Absolute effect calculated from King 2012. ⁹³		

Outcome	Anticipated absolute effects ^a (95% CI)		Relative effect No. of C		Certainty of	Comments
	Risk with infrequent SM use	Risk with frequent SM use	(95% CI)	(studies)	the evidence	
Multiple risk behaviours	41.3% of participants in the control group engaged in multiple risk behaviours	55.2% of exposed group participants engaged in multiple risk behaviours (47.8 to 62.3%)	OR 1.75 (1.30 to 2.35)	43,571 (2 observational studies)	$ \bigoplus_{v,x,y} \bigcirc \bigcirc \bigcirc \\ \bigcirc \\ \hline Very low \\ v,x,y \\ \lor \\ \bigcirc \bigcirc \bigcirc \bigcirc \bigcirc \\ \hline \\ \hline \\ \hline \\ \hline \\ \hline \\ \hline \\ \hline$	Downgraded for RoB and inconsistency. Frequent social media use may increase adolescent engagement in multiple risk behaviours. Absolute effect calculated from Beebe 2005. ³⁹

GRADE Working Group grades of evidence

High certainty $\oplus \oplus \oplus \oplus$: We are very confident that the true effect lies close to that of the estimate of the effect

Moderate certainty $\oplus \oplus \oplus \ominus$: We are moderately confident in the effect estimate: The true effect is likely to be close to the estimate of the effect, but there is a possibility that it is substantially different **Low certainty** $\oplus \oplus \ominus \ominus$: Our confidence in the effect estimate is limited: The true effect may be substantially different from the estimate of the effect

Very low certainty $\oplus \ominus \ominus \ominus$: We have very little confidence in the effect estimate: The true effect is likely to be substantially different from the estimate of effect

Explanations for upgrading/downgrading the evidence

^a Not downgraded for RoB, as most studies were low RoB, assessed exposure and outcome via validated tools, and no difference in effect size in high RoB studies was observed on stratification.

^b Not downgraded for inconsistency as heterogeneity was moderate ($I^2 = 39.3\%$) and all 95% confidence intervals overlapped.

^c Not downgraded for indirectness as only 1/9 studies assessed text messaging as well as social media use.

^d Not downgraded for imprecision as 95% confidence interval did not cross the null effect, was narrow and did not include appreciable harm or benefit.

² Unable to assess publication bias via a funnel plot due to insufficient data, however as a systematic search was conducted the chance of publication bias is reduced.

^f Downgraded for RoB as half of the studies were rated high RoB, only one study assessed exposure and outcome via validated tools, and all but one study failed to adjust for critical confounding domains.

^g Not downgraded for indirectness as majority of included studies specifically assessed social media use.

^h Not downgraded for imprecision as 95% confidence interval did not cross the null effect, was narrow and did not include appreciable harm or benefit.

ⁱ Downgraded for RoB, as although majority of included studies were low/moderate RoB, the contributing high RoB studies report notably larger effect sizes.

^j Downgraded for serious inconsistency as heterogeneity of included studies was considerable ($I^2 = 95.7\%$).

^k Not downgraded for imprecision as 95% confidence interval did not cross null effect, was narrow and did not include appreciable harm or benefit.

Downgraded for RoB as all studies were moderate/high RoB, failed to adjust for critical confounding domains, and assessed exposure and outcome via non-validated tools.

^m Downgraded for serious imprecision as wide 95% confidence interval suggests lack of confidence in estimate.

ⁿ Downgraded for RoB, as majority of studies were high RoB, failed to adjust for critical confounding domains, and assessed exposure and outcome via non-validated tools.

² Not downgraded for serious inconsistency as heterogeneity was reduced when stratification was performed by socioeconomic position, age, social media category and development status of study setting.

^p Not downgraded for indirectness as only 1/10 studies assessed text messaging as well as social media use.

^q Not downgraded for imprecision as 95% confidence interval did not cross null effect, was narrow and did not include appreciable harm or benefit.

r Downgraded for suspected publication bias given impression from asymmetric contour enhanced funnel plot.

^s Downgraded for RoB as majority of studies were high RoB, failed to adjust for critical confounding domains, and assessed exposure via non-validated tools.

^t Not downgraded for indirectness as no concerns were raised regarding population, intervention, comparator, direct comparisons, or outcome.

^u Not downgraded for imprecision as 95% confidence interval does not cross null effect and does not include appreciable harm or benefit.

^v Downgraded for RoB as all studies were high RoB, failed to adjust for critical confounding domains, and assessed exposure and outcome via non-validated tools.

* Downgraded for serious inconsistency as heterogeneity of included studies was considerable (I² = 97.9%) and confidence intervals show no or minimal overlap.

* Not downgraded for imprecision as 95% confidence interval did not cross null effect, was narrow and did not include appreciable harm or benefit.

Legend: ^a The risk in the intervention group (and its 95% confidence interval) is based on the assumed risk in the comparison group and the relative effect of the intervention (and its 95% CI). Abbreviations: CI = Confidence interval; OR = Odds ratio; and RoB = Risk of bias.

Table B. Post-hoc analysis: summary of findings and certainty of evidence for unhealthy dietary behaviour (as per GRADE) with reasons for upgrading/downgrading of the evidence

Population/setting: Adolescents aged 10-19 years in high and low-middle income settings **Intervention**: Exposure to health-risk behaviour content **Comparison**: No exposure to health-risk behaviour content

-	1			
Outcome	Effect direction	No. of participants (studies)	Certainty of the evidence (GRADE)	Comments
Unhealthy dietary behaviour (effect direction)	All studies demonstrated a harmful effect of social media use on adolescent engagement in unhealthy dietary behaviours (51.0 to 100.0%)	521 (4 randomised control trials)	⊕⊕⊕⊖ Moderate _{a,b}	Downgraded for indirectness. Exposure to health-risk behaviour content on social media increases adolescent engagement in unhealthy dietary behaviours.

GRADE Working Group grades of evidence

High certainty $\oplus \oplus \oplus \oplus$: We are very confident that the true effect lies close to that of the estimate of the effect

Moderate certainty $\oplus \oplus \oplus \odot$: We are moderately confident in the effect estimate: The true effect is likely to be close to the estimate of the effect, but there is a possibility that it is substantially different **Low certainty** $\oplus \oplus \odot \odot$: Our confidence in the effect estimate is limited: The true effect may be substantially different from the estimate of the effect **Very low certainty** $\oplus \odot \odot \odot$: We have very little confidence in the effect estimate: The true effect is likely to be substantially different from the estimate of effect

Explanations for upgrading/downgrading the evidence

^a Not downgraded for RoB as all studies were RCT's, with two rated low RoB and two some concerns.

^b Downgraded for serious indirectness of comparator, as two studies used a comparator group pertaining to healthy food exposure and the remaining two used a comparator group pertaining to exposure to non-food items.

Legend: Abbreviations: RoB = Risk of bias.

Objectives	4	Provide an explicit statement of the objective(s) or question(s) the review addresses.	Manuscript: Introduction
METHODS	1		
Eligibility criteria	5	Specify the inclusion and exclusion criteria for the review and how studies were grouped for the syntheses.	Manuscript: Study inclusion and exclusion criteria Appendix 5: Process of social media categorisation
Information sources	6	Specify all databases, registers, websites, organisations, reference lists and other sources searched or consulted to identify studies. Specify the date when each source was last searched or consulted.	Manuscript: Search methods for identification of studies Manuscript: Figure-2 PRISMA study flow chart Appendix 3: Details of search strategies conducted
Search strategy	7	Present the full search strategies for all databases, registers and websites, including any filters and limits used.	Manuscript: Search methods for identification of studies Appendix 3: Details of search strategies conducted
Selection process	8	Specify the methods used to decide whether a study met the inclusion criteria of the review, including how many reviewers screened each record and each report retrieved, whether they worked independently, and if applicable, details of automation tools used in the process.	Manuscript: Study inclusion and exclusion criteria Manuscript: Selection of studies Manuscript: Data extraction and RoB assessment
Data collection process	9	Specify the methods used to collect data from reports, including how many reviewers collected data from each report, whether they worked independently, any processes for obtaining or confirming data from study investigators, and if applicable, details of automation tools used in the process.	Manuscript: Selection of studies Manuscript: Data extraction and RoB assessment

Section and Topic	Item #	Checklist item	Location where item is reported
			Appendix 8: Data extraction form exemplar
Data items	10a	List and define all outcomes for which data were sought. Specify whether all results that were compatible with each outcome domain in each study were sought (e.g. for all measures, time points, analyses), and if not, the methods used to decide which results to collect.	Manuscript: Study inclusion and exclusion criteria Appendix 6: Included outcomes Appendix 7: Meta-analyses and synthesis without meta-analysis (SWiM) decision rules
	10b	List and define all other variables for which data were sought (e.g. participant and intervention characteristics, funding sources). Describe any assumptions made about any missing or unclear information.	Manuscript: Study inclusion and exclusion criteria Appendix 8: Data extraction form exemplar
Study risk of bias assessment	11	Specify the methods used to assess risk of bias in the included studies, including details of the tool(s) used, how many reviewers assessed each study and whether they worked independently, and if applicable, details of automation tools used in the process.	Manuscript: Data extraction and RoB assessment Appendix 9: Newcastle-Ottawa Scale (NOS) risk of bias assessment
Effect measures	12	Specify for each outcome the effect measure(s) (e.g. risk ratio, mean difference) used in the synthesis or presentation of results.	Manuscript: Data synthesis Appendix 10: Process for data transformations for meta-analysis
Synthesis methods	13a	Describe the processes used to decide which studies were eligible for each synthesis (e.g. tabulating the study intervention characteristics and comparing against the planned groups for each synthesis (item #5)).	Manuscript: Data synthesis Appendix 7: Meta-analyses and synthesis without meta-analysis (SWiM) decision rules
	13b	Describe any methods required to prepare the data for presentation or synthesis, such as handling of missing summary statistics, or data conversions.	Manuscript: Data synthesis Appendix 7: Meta-analyses and synthesis without meta-analysis (SWiM) decision rules Appendix 10: Process for data transformations for meta-analysis
	13c	Describe any methods used to tabulate or visually display results of individual studies and syntheses.	Manuscript: Data synthesis Appendix 7: Meta-analyses and synthesis without meta-analysis (SWiM) decision rules
	13d	Describe any methods used to synthesize results and provide a rationale for the choice(s). If meta-analysis was performed, describe the model(s), method(s) to identify the presence and extent of statistical heterogeneity, and software package(s) used.	Manuscript: Data synthesis Appendix 15: Meta-analyses, meta- regression, subgroup, and sensitivity analyses
	13e	Describe any methods used to explore possible causes of heterogeneity among study results (e.g. subgroup analysis, meta-regression).	Manuscript: Data synthesis
	13f	Describe any sensitivity analyses conducted to assess robustness of the synthesized results.	Manuscript: Data synthesis

Section and Topic	Item #	Checklist item	Location where item is reported			
Reporting bias assessment	14	Describe any methods used to assess risk of bias due to missing results in a synthesis (arising from reporting biases).	Manuscript: Data synthesis			
Certainty assessment	15	Describe any methods used to assess certainty (or confidence) in the body of evidence for an outcome.	Manuscript: Certainty of the evidence			
RESULTS	ir.					
Study selection	16a	Describe the results of the search and selection process, from the number of records identified in the search to the number of studies included in the review, ideally using a flow diagram.	Manuscript: Results Manuscript: Figure-2 PRISMA study flow diagram			
	16b	Cite studies that might appear to meet the inclusion criteria, but which were excluded, and explain why they were excluded.	Appendix 12: Characteristics of excluded studies			
Study characteristics	17	Cite each included study and present its characteristics.	Manuscript: Results Appendix 11: Characteristics of included studies			
Risk of bias in studies	18	Present assessments of risk of bias for each included study.	Manuscript: Results Appendix 13: Risk of bias domain and overall grade for included datapoints and studies Appendix 18: Summary of findings and certainty of the evidence			
Results of individual studies	19	For all outcomes, present, for each study: (a) summary statistics for each group (where appropriate) and (b) an effect estimate and its precision (e.g. confidence/credible interval), ideally using structured tables or plots.	Manuscript: Results Manuscript: Figures 4A-C Manuscript: Figures 5A-D Appendix 16: Synthesis without meta- analysis, meta-analyses, meta- regression, subgroup, and sensitivity analyses			
Results of syntheses	20a	For each synthesis, briefly summarise the characteristics and risk of bias among contributing studies.	Manuscript: Results Appendix 13: Risk of bias domain and overall grade for included datapoints and studies Appendix 18: Summary of findings and certainty of the evidence S13 Appendix 14: Social media measures reported in included studies			
	20b	Present results of all statistical syntheses conducted. If meta-analysis was done, present for each the summary estimate and its precision (e.g. confidence/credible interval) and measures of statistical heterogeneity. If comparing groups, describe the direction of the effect.	Manuscript: Results Manuscript: Figures 4A-C Manuscript: Figures 5A-D Appendix 16: Synthesis without meta- analysis, meta-analyses, meta- regression, subgroup, and sensitivity analyses			

Section and Topic	Item #	Checklist item	Location where item is reported		
	20c	Present results of all investigations of possible causes of heterogeneity among study results.	Manuscript: Results Appendix 16: Synthesis without meta- analysis, meta-analyses, meta- regression, subgroup, and sensitivity analyses Appendix 17: Assessment of publication bias/small study effects		
	20d	Present results of all sensitivity analyses conducted to assess the robustness of the synthesized results.	Manuscript: Results Appendix 16: Synthesis without meta- analysis, meta-analyses, meta- regression, subgroup, and sensitivity analyses		
Reporting biases	21	Present assessments of risk of bias due to missing results (arising from reporting biases) for each synthesis assessed.	Manuscript: Results Appendix 13: Risk of bias domain and overall grade for included datapoints and studies Appendix 18: Summary of findings and certainty of the evidence		
Certainty of evidence	22	Present assessments of certainty (or confidence) in the body of evidence for each outcome assessed.	Manuscript: Certainty of evidence Appendix 18: Summary of findings and certainty of the evidence		
DISCUSSION	1				
Discussion	23a	Provide a general interpretation of the results in the context of other evidence.	Manuscript: Discussion		
	23b	Discuss any limitations of the evidence included in the review.	Manuscript: Discussion		
	23c	Discuss any limitations of the review processes used.	Manuscript: Discussion		
	23d	Discuss implications of the results for practice, policy, and future research.	Manuscript: Discussion		
OTHER INFORMAT	TON				
Registration and protocol	24a	Provide registration information for the review, including register name and registration number, or state that the review was not registered.	Manuscript: Methods Appendix 20: Registered/published protocols		
	24b	Indicate where the review protocol can be accessed, or state that a protocol was not prepared.	Manuscript: Methods Appendix 20: Registered/published protocols		
	24c	Describe and explain any amendments to information provided at registration or in the protocol.	Manuscript: Methods Appendix 2: Deviations from protocol		
Support	25	Describe sources of financial or non-financial support for the review, and the role of the funders or sponsors in the review.	Manuscript: Funding		
Competing interests	26	Declare any competing interests of review authors.	Manuscript: Competing interests		
Availability of data,	27	Report which of the following are publicly available and where they can be found: template data collection forms; data extracted from	Manuscript: Data sharing		

Section and Topic	Item #	Checklist item	Location where item is reported
code and other materials		included studies; data used for all analyses; analytic code; any other materials used in the review.	

Table B. PRISMA 2020 structured abstract checklist

Section and Topic	Item #	Checklist item	Reported (Yes/No)
TITLE	и Т		
Title	1	Identify the report as a systematic review.	Yes
BACKGROUND			
Objectives	2	Provide an explicit statement of the main objective(s) or question(s) the review addresses.	Yes
METHODS			
Eligibility criteria	3	Specify the inclusion and exclusion criteria for the review.	Yes
Information sources	4	Specify the information sources (e.g. databases, registers) used to identify studies and the date when each was last searched.	Yes
Risk of bias	5	Specify the methods used to assess risk of bias in the included studies.	Yes
Synthesis of results	6	Specify the methods used to present and synthesise results.	Yes
RESULTS			
Included studies	7	Give the total number of included studies and participants and summarise relevant characteristics of studies.	Yes
Synthesis of results	8	Present results for main outcomes, preferably indicating the number of included studies and participants for each. If meta-analysis was done, report the summary estimate and confidence/credible interval. If comparing groups, indicate the direction of the effect (i.e. which group is favoured).	Yes
DISCUSSION			
Limitations of evidence	9	Provide a brief summary of the limitations of the evidence included in the review (e.g. study risk of bias, inconsistency and imprecision).	Yes
Interpretation	10	Provide a general interpretation of the results and important implications.	Yes
OTHER	1		
Funding	11	Specify the primary source of funding for the review.	Yes
Registration	12	Provide the register name and registration number.	Yes
