

Supplementary Figure S3. Predicted DNA ploidy.

Violin plot illustrating the predicted DNA ploidy of a subset of p53-abnormal low-grade endometrioid endometrial carcinomas (EEC), p53-abnormal serous endometrial carcinomas (EC) and NSMP low-grade EEC. DNA ploidy could be in 53.3% (n=24/45) of the cases and in 42.9% (n=9/21) of the reference set with successful shallow whole genome sequencing-based copy number plots.
