

Supplementary Figure S4. H&E, immunohistochemistry stains and relative copy number plot of a case diagnosed as low-grade EEC by ≥ 3 pathologists.

The case showed endometrioid-type morphological features on H&E including glandular architecture (A, 10x magnification) and smooth luminal borders with mild nuclear atypia (B, 20x magnification). Immunohistochemistry (IHC) showed mutant-type p53-expression (C), weak patchy p16 staining (D), ER and PR positivity (E and F), absence of L1CAM expression with positive internal control (G); all IHC images taken at 20x magnification. The relative copy number plot (H) showed >10 somatic copy number alterations.
