

Sup. Figure 1: Representative images of pediatric KS biopsies stained with control or anti-LANA antibody at indicated magnification. Location of the biopsy is on the right.

# Pediatric 2008-2010

**Sup. Figure 2:** Shown are the log<sub>10</sub> of HIV copy number on the vertical axis and the percent of CD4 cells of PBMC on the horizontal axis. Data are for pediatric participants, where available. The dashed lines indicate cutoff points. The red line indicates the linear regression.

Supplemental Figure 3:

(A) Volcano plot displaying differential expressed genes between pediatric and adult KS. The y-axis corresponds to the mean expression value of log 10 (adj p-value), and the x-axis displays the log2 fold change value. The red triangles represent the most significant ( $p < 1 \times 10^{-6}$ ) transcripts with differential expression between pediatric and adults KS. The grey dots represent the non-significant transcripts ( $p > 1 \times 10^{-6}$ ) between pediatric and adults KS. Genes with log2fold change  $> 10$  (1000-fold) are annotated. (B) Pathway analysis of the differentially regulated genes annotated in panel A. The most common GO-terms across multiple data bases are noted below the enrichment graph. (C) Pathway analysis of the differentially regulated genes excluding mitochondrial genes.
