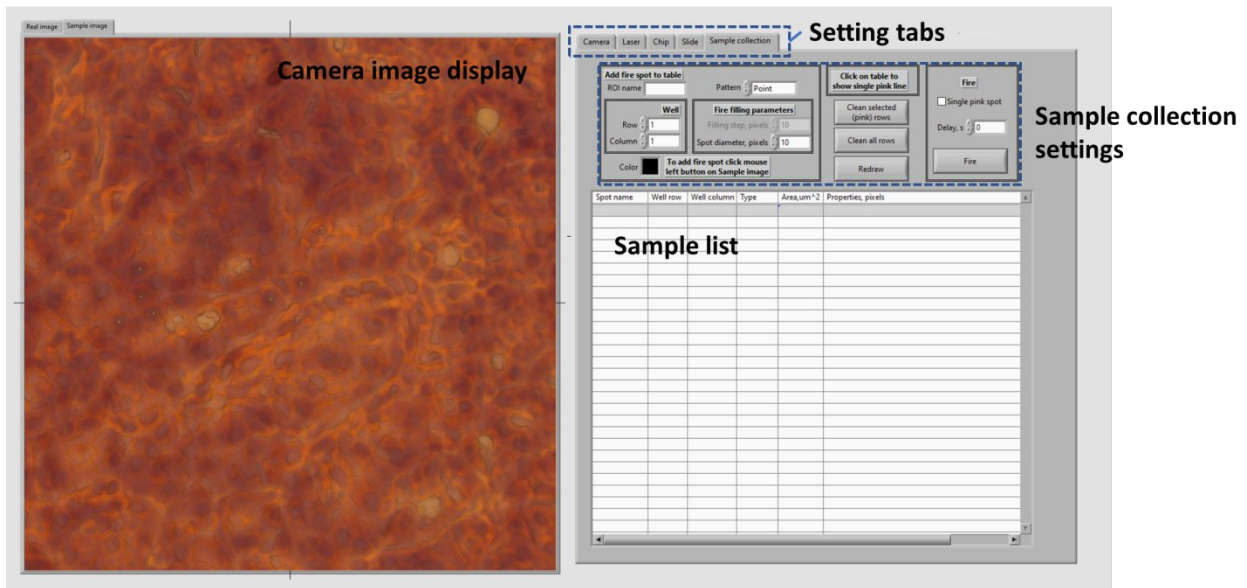

Fig. S2. Screenshot of the prototype LabView program for controlling the sample collection process.

Fig. S3. Schematic illustration of the alignment procedures for nanoPOTS chip.

The chip stage robot was moved until the top left alignment spot is clearly visible in the camera frame at a target position. The stage location information was recorded in the software. The same procedure was repeated for left front and right front alignment spots. The right back alignment spot was used for checking the alignment. All well's locations can be calculated with the stage location information from the first three alignment spots.

A nanoPOTS chip aligned. Now nanoPOTS chip is at a well's regular location.

B nanoPOTS chip at parking. Sample slide is installed and is at focal plane.

C If sample is at focal plane and the nanoPOTS chip moves to a well's regular location, the two will collide.

D If sample is at focal plane and the nanoPOTS chip moves to a well's regular location with Z delta, they will not collide.

Fig. S4. Schematic illustration of the alignment procedures for adjusting the collection distance (chip Z-delta) between nanoPOTS chip and tissue slide.

Fig. S5. The image acquisition sequence of the 3×3 grid on the left and a stitched pancreas image on the right.

Fig. S6. Square ablation holes on pancreas when a square pinhole was used.

Fig. S7. The schematic illustration of the DMSO splashing phenomena during sample collection. High velocity aerosol particles generated by laser ablation hits a DMSO droplet. Due to the close proximity, the contact velocity of the aerosol on the DMSO droplet is high enough to splash DMSO which is visible under the microscope (in the following Figure S8).

Fig. S8. Images taken immediately after ablation on pancreas using different laser energy levels. Each image is $0.3 \text{ mm} \times 0.3 \text{ mm}$. The collection distance was 0.1 mm for all. The energy was set on the laser control software. Higher laser energy (6 mJ) led to more severe DMSO splashing. To confirm that the DMSO splashing was not caused by the laser beam itself, we performed ablation on an area without pancreas sample (6 mJ , no sample). No DMSO splashing visible without pancreas sample.
