### Supplemental Table 1: Estimate of $b$ under different mosquito infection criteria

Bold values are reported in the manuscript.

Hypotheses i and ii were assessed for different mosquito infection criteria. The number of infectious bites per individual in the low exposure group was set to 1, or the number of mosquitoes with PCR positive bodies was used. The number of infectious bites per individual in the high exposure group was a multiplication of 1) the number of mosquitoes a sheep was exposed to, or the number of mosquitoes that had taken a blood meal (engorged), and 2) the proportion of mosquitoes with RVFV particles in saliva or the proportion of mosquitoes with PCR positive bodies. The estimated proportion (mean), lower and upper confidence interval values were used to capture conservative and optimistic scenarios.

| Hypot hesis | $b$         | CI low      | CI high     | AIC          | Low_exposure               | High_Expos ure_type | High_Exposur e_proportion | High_Exposur e_estimate |
|-------------|-------------|-------------|-------------|--------------|----------------------------|---------------------|---------------------------|-------------------------|
