

## Supplementary Figure 2. Biochemical blood analysis of macaques after vaccination.

The biochemical blood test included the analysis of the following parameters: glucose oxidase (GLU), alkaline phosphatase (ALP), alanine aminotransferase (ALT), aspartate aminotransferase (AST), lactate dehydrogenase (LDH), total bilirubin (TB), urea nitrogen (BUN), creatinine (CRE), cholesterol (CHOL), triglycerides (TG), total protein (TP), albumin (ALB), globulin (GLB), sodium (Na), and potassium (K). Differences in the studied variables between animal groups were assessed using Tukey's multiple comparisons test. \* $P < 0.05$ , \*\* $P < 0.01$  and \*\*\* $P < 0.001$ . The broken line shows the upper limit of the physiological norm.
