<sup>a</sup> Markers are named according to their position in the aligned sequence, where +1 denotes the translation start site. The common variant is listed first.

<sup>b</sup> Frequency of rare allele (number of lines with rare allele).

<sup>c</sup> Markers exhibiting associations with quantitative traits at the Bonferroni-corrected experiment-wise significance threshold: M6 (environmental variance of abdominal bristle number), M7 (sternopleural bristle number), M10 (abdominal bristle number and environmental variance of abdominal bristle number), M15 (locomotor reactivity), M19 (life span), M24 (abdominal bristle number), M28 (locomotor reactivity), and M30 (sternopleural bristle number).

<sup>d</sup> Markers nominally (*p* < 0.05) associated with starvation stress resistance.

<sup>a</sup> LS, life span; LR, locomotor reactivity; SB, sternopleural bristle number; AB, abdominal bristle number;  $CV_E$  AB, environmental variance in abdominal bristle number; SR, starvation resistance.

<sup>b</sup> Difference in means between common and rare allele.

<sup>c</sup> Absolute values of the effects, expressed in genetic ( $\sigma_G$ ) and phenotypic ( $\sigma_P$ ) standard deviation units.

<sup>d</sup> Variance attributable to the marker.

<sup>e</sup> Fraction of total variance attributable to the marker.

<sup>f</sup> Haplotypes derived from all 87 population haplotypes (H<sub>ALL</sub>).
