

Supplementary Fig. 5. No correlation of interferon-induced transmembrane protein 3 (IFITM3) expression in intrinsic tyrosine kinase inhibitor (TKI) resistance. There was no prognostic significance of IFITM3 expression in the overall and progression-free survivals of 89 cases of advanced clear cell renal cell carcinoma (ccRCC) cohort (A), and in recurrence and progression-free survival of previously reported 53 ccRCC patients treated with sunitinib (B).
