

## Supplementary information

# The PfRCR complex bridges malaria parasite and erythrocyte during invasion

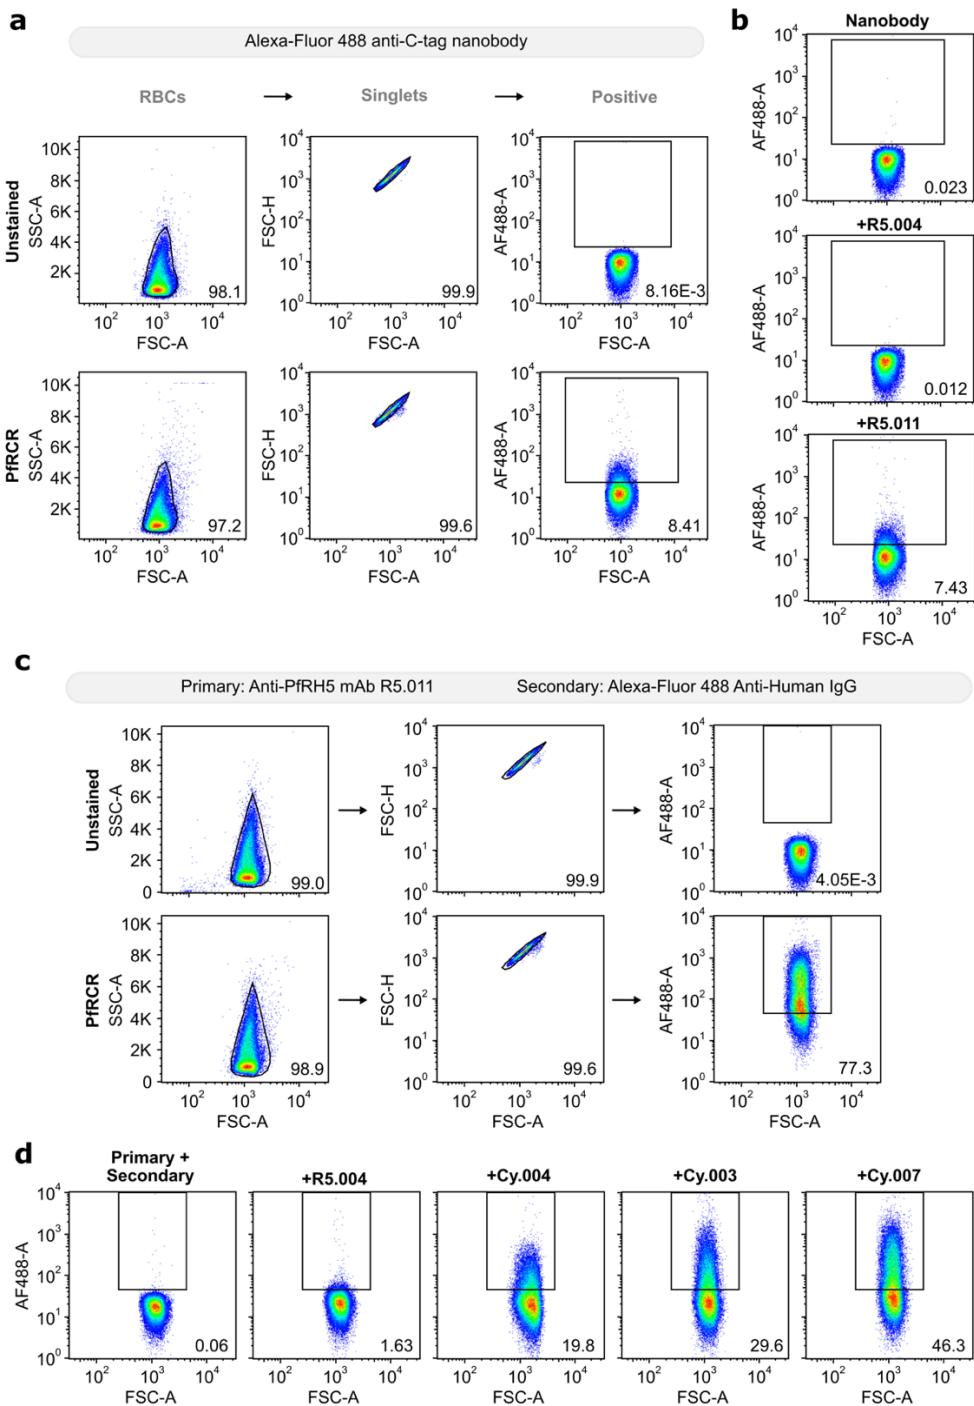

---

In the format provided by the  
authors and unedited

## Supplementary Figure 1: Uncropped gels.

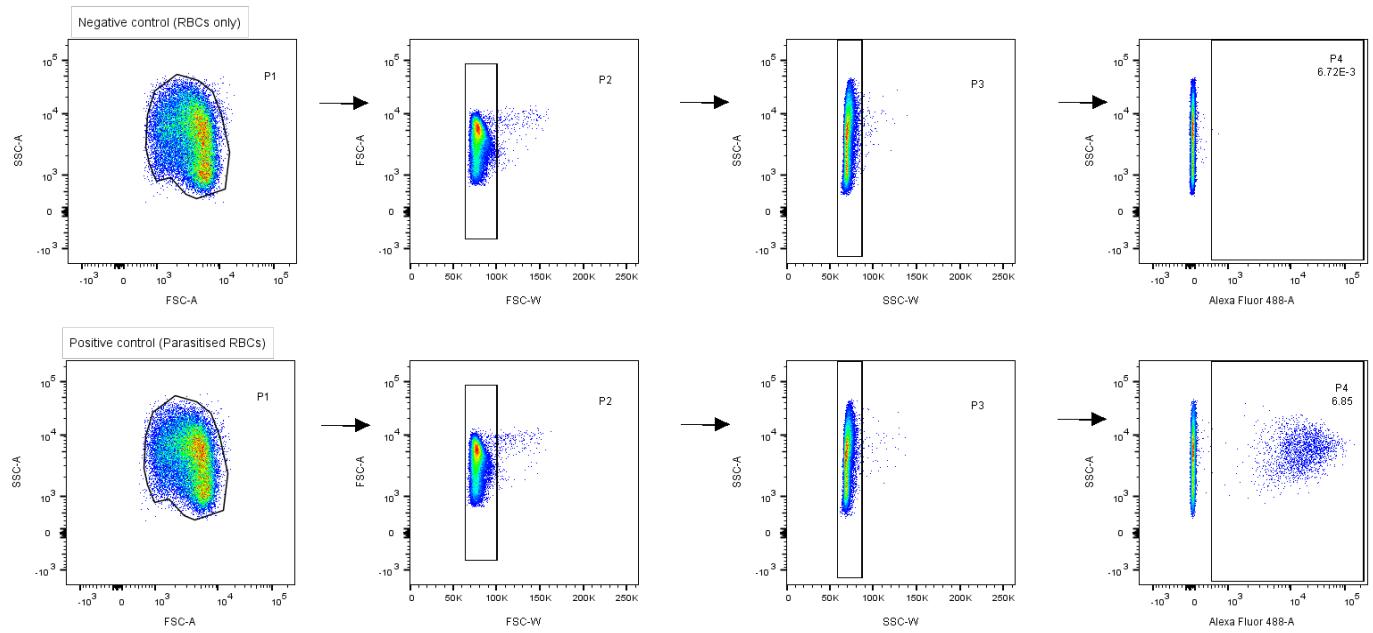

## Supplementary Figure 2: FACS gating for PfRCR erythrocyte binding assay.

**a**, Representative scatter plots for the PfRCR erythrocyte binding assay by flow cytometry showing the gating strategy when using the Alexa-Fluor 488 anti-C-tag detection method. Plots for unstained cells and those incubated with PfRCR are shown. Red blood cells (RBCs) were gated using forward scatter area (FSC-A) vs side scatter area (SSC-A), then singlets gated using FSC-A vs forward scatter height (FSC-H). Finally, PfRCR positive cells were gated by plotting FSC-A vs Alexa-Fluor 488 area (AF488-A) and using the gate shown. **b**, Representative scatter plots showing gating of PfRCR positive cells for erythrocytes incubated with anti-C-tag nanobody alone, PfRCR + R5.004, and PfRCR + R5.011. The same gating strategy was used as in (a). The gating strategy in (a) and (b) were used for data presented in Extended Data Figure 8e. **c**, Representative scatter plots for PfRCR erythrocyte binding showing the gating strategy used when using the R5.011 then Alexa-Fluor 488 anti-human IgG detection method. Plots for unstained cells and those incubated with PfRCR are shown. Gating was performed as in (a) using the gates shown. **d**, Representative scatter plots showing gating of PfRCR positive erythrocytes following incubation with primary and secondary antibodies only, with PfRCR + R5.004, PfRCR + Cy.004, PfRCR + Cy.003, and PfRCR + Cy.007. In all plots, the number of gated cells in each plot is shown as a percentage in the bottom right corner of each plot. This gating strategy was used for data presented in Figure 4d.

**Supplementary Figure 3: FACS gating used to analyse the proportion of SYBR-positive, parasite infected erythrocytes vs uninfected erythrocytes within a given sample.**

Top panels indicate an erythrocyte (RBC) only, negative control. Bottom panels depict a representative sample containing parasitised erythrocytes. For each set of panels, the percentage of SYBR positive cells is indicated under gate P4. Staining and gating strategies are described in full in the materials and methods section. This gating strategy was used for data presented in Figure 2g.

| <b>Relative parasitaemia</b> | 90.95714564 | 103.0651114 | 94.799736  | 89.613115  | 92.7048448        | 3.31554855 |

**Supplementary Table 4: Summary data of comparison between relative parasitaemia of DMSO and Rap treated lines.**

| Line     | Mean of DMSO | Mean of Rap | SEM of DMSO | SEM of Rap | Significant difference between DMSO and Rap (two-tailed, unpaired t-test)? | P-value  | t statistic | df | CI              |
|----------|--------------|-------------|-------------|------------|--|----------|-------------|----|-----------------|
| PfRH5cKO | 94.12        | 4.041       | 3.068872338 | 0.51113859 | Yes  | 0.000008 | 28.95       | 4  | 81.44 to 98.72  |
| PfRH5WT  | 82.55        | 87.65       | 4.202175814 | 7.89966194 | No   | 0.599128 | 0.5701      | 4  | -29.92 to 19.74 |
| PfRH5CL  | 87.61        | 81          | 4.119765643 | 6.89400957 | No   | 0.456857 | 0.8228      | 4  | -15.69 to 28.91 |

| Line   | PfRH5cKO       | PfRH5WT         | PfRH5CL         |
|--|----------------|-----------------|-----------------|
| Mean of DMSO   | 94.12          | 82.55           | 87.61           |
| Mean of Rap  | 4.041          | 87.65           | 81              |
| SEM of DMSO  | 3.068872338    | 4.202175814     | 4.119765643     |
| SEM of Rap   | 0.511138591    | 7.899661941     | 6.89400957      |
| Significant difference between DMSO and Rap (two-tailed, unpaired t-test)? | Yes            | No              | No              |
| P-value  | 0.000008       | 0.599128        | 0.456857        |
| t statistic  | 28.95          | 0.5701          | 0.8228          |
| df   | 4              | 4               | 4               |
| CI   | 81.44 to 98.72 | -29.92 to 19.74 | -15.69 to 28.91 |

Note that statistical significance tests whether parasitaemia differs for each transgenic cell line ( $\text{PfRH5}^{\text{cKO}}$ ,  $\text{PfRH5}^{\text{WT}}$  or  $\text{PfRH5}^{\text{CL}}$ ) independently, when treated with DMSO or Rapamycin. Therefore, no adjustments have been made for multiple comparisons.
