

S2 Table: GLM model 1 for WURSS-11 AUC (without imputation)

Fixed factors		AUC WURSS (not imputed)			Type 3 two-sided p-values
		Stratum 1: ≤ 12 hours	Stratum 2: 12-24 hours	Stratum 3: > 24 hours	
LS mean (95% CI) ^{a, c}		119.7 [98.6, 140.9]	164.0 [139.8, 188.2]	232.4 [208.6, 256.1]	
Difference between LS means (95% CI) ^{b, c}		-112.6 [-141.0, -84.3]	-68.4 [-98.9, -37.9]	N/A	
Type 3 effects ^a	Time to treatment stratum				<.0001
	Age				0.9898
	Sex				0.9170
	Previous influenza vaccination				0.0125
	Baseline WURSS Score				<.0001

^a Model contains time-to-treatment strata, baseline total symptom score, sex, age, vaccination status.

^a Non-overlapping confidence intervals of LS-Means between 2 Strata indicate a significant difference between strata.

^b Compared with initiation of therapy at > 24 hours after start of illness.

^b If 0 is outside the confidence interval for the differences between LS-Means then this comparison is significant.

^c N/A: not applicable, CI: confidence interval.
