ABSTRACT (347/400 words)

Objective: To create case definitions for confirmed COVID diagnoses, COVID vaccination status, and three separate definitions of high risk of severe COVID, as well as to assess whether the implementation of these definitions in a cohort reflected the sociodemographic and clinical characteristics of COVID epidemiology in England.

Design: Retrospective cohort study

Setting: Electronic healthcare records from primary care (Clinical Practice Research Datalink, or CPRD) linked to secondary care data (Hospital Episode Statistics, or HES) data covering 24% of the population in England

Participants: 2,271,072 persons aged 1 year and older diagnosed with COVID in CPRD Aurum between August 1, 2020 through January 31, 2022.

Main Outcome Measures: Age, sex, and regional distribution of COVID cases and COVID vaccine doses received prior to diagnosis were assessed separately for the cohorts of cases identified in primary care and those hospitalized for COVID (primary diagnosis code of ICD-10 U07.1 "COVID-19"). Smoking status, body mass index and Charlson Comorbidity Index were compared for the two cohorts, as well as for three separate definitions of high risk of severe disease used in the United Kingdom (NHS Highest Risk, PANORAMIC trial eligibility, UK Health Security Agency Clinical Risk prioritization for vaccination).

Results: Compared to national estimates, CPRD case estimates underrepresented older adults in both the primary care (age 65-84: 6% in CPRD vs 9% nationally) and hospitalized (31% vs 40%) cohorts, and overrepresented people living in regions with the highest median wealth areas of England (20% primary care and 20% hospital admitted cases in South East, vs 15% nationally). The majority of non-hospitalized cases and all hospitalized cases had not completed primary series vaccination. In primary care, persons meeting high risk definitions were older, more often smokers, overweight or obese, and had higher Charlson Comorbidity Index score.

Conclusions: CPRD primary care data is a robust real-world data source and can be used for some COVID research questions, however limitations of the data availability should be carefully considered. Included in this publication are supplemental files for a

total of over 28,000 codes to define each of three definitions of high risk of severe disease.

SUMMARY BOXES

Strengths of study methods

- To our knowledge, we offer the first publication of code lists for each of these high-risk definitions, which can now be readily used in datasets that contain CPRD medical and product, ICD-10 and OPCS Classification of Interventions and Procedures codes.
- Given the mandatory reporting of PCR tests, regardless of result, back to GP, the CPRD should have nearly complete capture of confirmed COVID cases in this pre-antigen test era.
- Similarly, COVID vaccines administered at any location in the country were also mandated to be reported to patient's GP.

Limitations of study methods

- While the data in this publication represent the most recent sets available from CPRD as of 22 March 2023, the primary care data have not been released since May 2022 and the secondary care data have not been released since March 2021.
- The present study does not capture persons not under GP care, or COVID cases who presented directly to hospital without first having a recorded diagnosis with their general practitioner.

INTRODUCTION

As of 3 February 2023, there have been over 20 million confirmed COVID cases and more than 183,000 related deaths in England.¹ COVID severity ranges from asymptomatic cases to severe disease requiring hospital admission and sometimes death, with older adults and people with chronic health conditions at disproportionate risk.^{2,3} Therefore, electronic health records (EHR) with longstanding capture of patients' medical history are uniquely positioned to answer population-based questions related to healthcare resource utilization, economic impact, and pharmaceutical intervention associated with COVID.

The Clinical Practice Research Datalink (CPRD) is a longitudinal and anonymized EHR database of primary health care interactions in England.⁴ Primary care is the cornerstone of healthcare in England, with over 98% of the population registered with a general practitioner (GP). From August 2020 through March 2022, the National Health Service (NHS) mandated that all polymerase chain reaction (PCR) tests for SARS-CoV-2, regardless of result, be reported to patients' GP.⁵ Similarly, COVID vaccines administered at any location in the country were also mandated to be reported to patient's GP.⁶ Thus, during this period, CPRD can be considered a closed network of confirmed COVID cases for persons in the network, with accurate information on COVID vaccination status.

While the CPRD has been used in over 3,000 peer-reviewed publications, it is not known whether interruptions in healthcare, particularly in-person primary care visits, during the first years of the coronavirus pandemic affected the previously described characteristics of the CPRD population. The objective of this study was to create case definitions for COVID diagnoses, COVID vaccination, and three separate definitions of high risk of severe COVID. Second, we aimed to evaluate these definitions in a cohort of persons with COVID in the CPRD to assess whether their sociodemographic and clinical characteristics reflected COVID epidemiology in England. The methodology developed in the study can be leveraged in future COVID research in CPRD data.

METHODS

Study Setting and Population

CPRD Aurum contains data which is routinely collected from primary care practices that use the EMIS Web® digital clinical system that includes electronic patient records.⁷ The May 2022 release of CPRD Aurum contained data from approximately 24% of persons in England.^{8,9} Data captured include age, sex, body weight, medical diagnoses, referrals to specialists and/or secondary care, prescriptions issued in primary care, laboratory tests, vaccinations administered, smoking and alcohol consumption status, and all other types of care delivered as part of routine primary care practice.

CPRD Aurum was linked to Hospital Episode Statistics Admitted Patient Care (HES APC) records, using deterministic patient-level linkage with an 8-stage algorithm carried out by NHS Digital. Over 99% of practices contributing to CPRD Aurum participate in HES linkage. The HES APC dataset includes patient demographics, date and method of hospital admission and discharge, diagnoses, specialty care, and procedures. HES APC data from April 1997 to March 2021 was available in this study.

Inclusion and Exclusion Criteria

We included persons of any age diagnosed with COVID (described below) from 1 August 2020 through 31 January 2022. First, we required records to be of acceptable research quality, as defined by CPRD. Second, we required people to be continuously registered with their GP practice for at least 365 days prior to COVID diagnosis, to establish pre-COVID health history. Third, we required persons to be HES APC linkage eligible to ensure the exclusion of patients where confirmed hospital admission status (via HES APC, during the time period available) could not be known. Fourth, we excluded persons who were admitted to the hospital on or before their primary care recorded date of COVID diagnosis. Due to mandatory reporting guidelines, the GP's date of notification from the hospital may be delayed from the date of true test collection and therefore may not accurately reflect date of diagnosis. Lastly, we excluded persons with a registration end date, practice last collection date or death date that was prior to their COVID diagnosis.

COVID Case Definition

With each monthly data release, CPRD publishes feasibility counts for SARS-CoV-2 related codes in CPRD primary care data with corresponding code lists.^{8,10} The code types include vaccination, tests (including PCR, antibody and antigen tests), diagnosis, advice, possible cases, and post-COVID clinic referral codes. Three reviewers (KA, QM, AS) independently screened the CPRD code list to determine which of the codes represented a confirmed and current infection. Discrepancies were adjudicated by a fourth reviewer (LM), and the final definition for the COVID case definition was reviewed by UK and non-UK clinicians (**eTable 1**). We defined a current and confirmed COVID episode as a diagnosis code, positive PCR, or antigen test. We did not include COVID vaccination, antibody tests, possible cases, exposure to COVID or post-COVID clinic referral codes in the COVID case definition.

Hospitalizations for COVID were defined as persons admitted with a primary diagnosis of COVID (ICD-10 U07.1 “COVID-19”) within 12 weeks of the initial diagnosis recorded in primary care. Non-hospitalized COVID cases were defined as the subset of persons for whom secondary care data were available but had no record of hospital admission. Primary care COVID cases were defined as persons who were not admitted to the hospital within 12 weeks of diagnosis, and those after April 1, 2021 for which hospital admission data were not available.

COVID Vaccination Definition

The first COVID vaccine dose in England was administered on 8 December 2020, with the initially limited supply prioritized for groups as outlined by the Joint Committee for Vaccinations and Immunisations (JCVI).¹¹ In England, COVID vaccines produced by Pfizer-BioNTech and Moderna have been available since December 2020. In April 2021, JCVI announced that persons who received a first dose of an AstraZeneca vaccine would receive a second dose of the same brand but persons who had not yet received a vaccine dose would be “preferentially offered an alternative”.¹² This study did not consider Novavax vaccinations, as it was approved for use after our index date, or

8 In Phase 1 (December 2020 - March 2021), people aged 50 and older, as well as front-
9 line health and social care workers, clinically extremely vulnerable persons and persons
10 aged 16 and older with underlying health conditions were eligible to receive two doses.
11 In Phase 2 (beginning April 2021), access broadened for persons aged 18-49 to receive
12 two doses. Additionally, immunocompromised persons who received two doses in
13 phase 1 were recommended to receive a third dose at least eight weeks after their
14 second dose in order to complete their primary series. Phase 3 included a single dose
15 for 16–17-year-olds in August 2021. In September 2021, 12–15-year-olds could receive
16 a single dose and a booster dose for adults was recommended at least 6 months after
17 the completion of a primary series. In November 2021, 12–17-year-olds could receive a
18 second dose, and the recommendation for booster dose was shortened to at least 3
19 months after the completion of a primary series.¹¹

30 We used a combination of product codes, which specify brand and dose of vaccine, as
31 well as medical codes which indicated administration of a non-specific COVID vaccine
32 (**eTable 2**). The code lists were derived from the published set by CPRD.¹⁰ While
33 patients may have multiple vaccination codes in their record on a given day, such as a
34 code to indicate both the administration as well as a separate code for the specific
35 product given, persons were not counted as receiving as more than one vaccine dose
36 per day.

44 Vaccination status at COVID diagnosis date was reported, regardless of brand, and
45 separately for immunocompromised versus non-immunocompromised persons.
46 Persons were considered unvaccinated if there was no record of COVID vaccination, or
47 for up to 13 days after first dose to account for time needed to build immunity following
48 immunisation. Dose 1 was defined starting 14 days after the record of the first COVID
49 vaccine administration until 13 days after the receipt of second dose, or until end of
50 follow-up. Dose 2 was defined starting 14 days after the record of the second COVID

4 were considered to have had 2 doses until 13 days before their next vaccine. For non-
5 immunocompromised persons, the primary vaccination series was complete 14 days
6 after second dose. For immunocompromised persons only, dose 3 was part of their
7 primary series at least 21 days after their second dose. First booster doses (winter
8 2021) were defined 21 or more days after the receipt of the last dose in primary series.
9 For all vaccination definitions, no upper limit on time between doses was applied.

16 17 **COVID Risk Status**

18 We considered three separate definitions of COVID risk status, each of which are set
19 forth by different groups and capture non-intersecting populations. First, the NHS
20 highest risk group, which was a list of conditions set forth by an advisory group
21 commissioned by England's Deputy Chief Medical Officer to identify persons at the very
22 highest risk of COVID hospital admission and death.¹⁴ Second, eligibility for the
23 PANORAMIC study, which began in December 2021 and is a platform randomized trial
24 of antiviral therapeutic agents.¹⁵ The persons who qualify for antiviral treatment in the
25 trial are those at a higher risk of hospital admission and death. Third, UK Health
26 Security Agency (UKHSA) clinical risk groups as outlined in "The Green Book" chapter
27 14a, which is COVID vaccination prioritization from the JCVI.¹⁶ For each of these three
28 risk definitions, we operationalized the clinical conditions lists into SNOMED and ICD-10
29 code lists. Where available, we used published code lists.¹⁷⁻²³ For concepts not found in
30 the literature, we developed wildcard-based search terms in the CPRD code browser
31 (**eTables 3-5**). At least one practicing clinician from the UK, who were independent and
32 external to Pfizer, reviewed each of the search term strategies, as well as ensuing code
33 lists.

48 **Comparison to Publicly Available Data**

49 We compared our results to estimates published on the UK Government's Coronavirus
50 dashboard, and restricted results to those specific to England, as the CPRD Aurum
51 population that is HES-linkage eligible contains data from England only.^{24,25} The data in

3 Where possible, we restricted the dashboard to cases from 1 August 2020 through 31
4 January 2022 to reflect the study period, although age, sex and region-specific
5 estimates were reported “since the start of the pandemic”.^{24,25} For whole country (non-
6 COVID related) comparisons, we used the Office of National Statistics’ 2021 Census.⁹

10 11 12 **Statistical Analyses**

13 All results are presented separately for the cohorts of persons with primary care versus
14 hospitalized COVID cases. Continuous variables are presented as means (standard
15 deviations) or medians (interquartile ranges) and categorical variables as counts
16 (percentages). Missing data for sex, region, smoking status and BMI is shown in tables.
17 The absence of codes for comorbidities was assumed to be the absence of the
18 comorbidity rather than missing data. Standardized mean differences (SMD) were used
19 to compare groups, with SMD > 10% indicating significant difference. As per CPRD
20 privacy rules, any cell with 10 persons or fewer (but not zero) was suppressed and other
21 cells related to the small cell count were redacted to ensure no back-calculation could
22 populate the count.

53 From 1 August 2020 through 31 January 2022, the UK Government’s Coronavirus
54 dashboard reported 14,744,991 COVID cases in England.²⁴ The final CPRD cohort
55

1
2
3 contained 2,271,072 persons diagnosed with COVID, regardless of care setting, in
4 England in the same time period (**eTable 6**). The case trends followed national
5 estimates, with a series of peaks and troughs with a large peak in winter 2021
6 (**eFigures 1 and 2**). Hospital admissions increased in fall 2020 and winter 2020
7 (**eFigure 3**).

8
9
10
11
12
13 There were 2,257,907 persons with COVID cases observed in primary care, which
14 included persons who were not hospitalized during the period of time for which hospital
15 admission data was available (n=522,288) as well as all COVID diagnoses recorded in
16 the period where hospital admission data ended (n=1,735,619). Separately, there were
17 13,165 persons (2% of COVID cases from August 2020 to March 2021) who were
18 hospitalized within 12 weeks of initial COVID diagnosis with a primary diagnosis of
19 COVID (**Figure 1**).

20 21 22 23 24 25 26 27 **Characteristics of COVID Cases**

28
29 For both primary care and hospitalized cases, the majority of persons with COVID were
30 adults aged 18-64 (**Table 1**). The age distribution of CPRD primary care cases
31 generally followed the national case count distribution, with young and middle-aged
32 adults representing the largest groups, as well as the largest fraction of the English
33 population (**eTable 7**). Older adults were underrepresented in both cohorts as
34 compared to national population estimates. Within the primary care cohort, 6% of
35 patients were aged 65-84 years, whereas 9% of national COVID cases occurred in this
36 age group. Notable differences were observed in the hospitalized cohort when
37 compared to the national estimates; 31% vs. 40% were aged 65 - 84 years, and 8% vs.
38 21% aged ≥ 85 years, respectively.

39
40
41
42
43
44
45
46
47
48 The sex distribution of COVID cases in the primary care cohort was comparable to
49 national estimates, with 55% female in each (**Table 1 and eTable 7**). There were more
50 males (57%) than females in the hospitalized cohort; there are no national sex-specific
51 hospital admission counts available.

1
2
3 The regional distributions of the CPRD primary care and hospitalized cohorts were
4 similar to each other, but not the overall country. Both of the study cohorts had larger
5 proportions of persons with GP practices in higher income regions of England as
6 compared to national case counts.²⁶ For example, 20% of persons in the primary care
7 cohort and 20% in the hospitalized cohort lived in South East region of England, the
8 region with the highest median total household wealth as reported in March 2020. This
9 is compared to 20% of CPRD contributing practices, 15% of all English cases and 16%
10 of the population lived in London (**eTable 8**). Similar trends are seen with lower median
11 total household wealth regions being proportionally underrepresented in the COVID
12 CPRD cohort as compared to national case estimates or population distribution.

22 **COVID Vaccination Status**

23
24 At the time of COVID diagnosis, 27% of non-immunocompromised persons and 36% of
25 immunocompromised persons had completed a primary series of COVID vaccination
26 (**Table 2**). Among the non-immunocompromised hospitalized COVID cases, 98% were
27 unvaccinated and none had completed a primary series. For immunocompromised
28 hospitalized COVID cases, 56% were unvaccinated, 44% had received one dose, and
29 none had completed a primary series. As of 1 December 2021, 86% of adults had ≥ 1
30 and 80% had ≥ 2 COVID vaccine doses (2% and 0.2% lower than official reports,
31 respectively).

40 **Populations at Risk of Severe Disease**

41 After wildcard searches, clinicians reviewed nearly 50,000 codes to set the definitions
42 for high-risk lists. The final lists contained 12,390 codes for NHS Highest Risk, 9,132
43 codes for PANORAMIC trial criteria and 7,343 codes for UKHSA Clinical Risk (**attached**
44 **as machine readable code list files**). In the primary care cohort, 11% met NHS
45 Highest Risk, 31% PANORAMIC, and 10% UKHSA Clinical Risk criteria (**Table 3**). With
46 each definition, primary care cohort cases at high risk were more often current smokers
47 (ranging from 17-21% vs 13% in full cohort) or former smokers (24-28% vs 13%),
48 overweight (16-19%, vs 9%) or obese (20-28%, vs 10%), and a larger proportion had at
49 least 1 comorbidity in the Charlson Index (29-54%, vs 11%), where this was recorded.

3 Primary care cases at high risk of severe disease were also older (mean age 49-55
4 years, vs 34 years), more often female (55-63%, vs 54%), and had more recorded
5 vaccine doses prior to COVID diagnosis (**eTable 9**).
6
7

8
9
10 Among hospitalized COVID cases, 33% met NHS Highest Risk, 84% PANORAMIC, and
11 41% UKHSA Clinical Risk criteria's (**Table 4**). The high risk hospitalized groups were
12 similar to the overall hospitalized cohort. Nearly half of persons were current smokers
13 (13-16%, vs 13%) or former smokers (32-39%, vs 29%), and more than half were
14 overweight (20-23%, vs 18%) or obese (37-42%, vs 35%). Among the hospital admitted
15 cohort, people meeting each high-risk definition were older (mean age 65-66 years, vs
16 60 years) (**eTable 10**). Subgroups of patients with the NHS and UKHSA definitions had
17 higher mean Charlson Comorbidity Indexes, and more females, than high risk patients
18 identified with the PANORAMIC criteria or the entire hospitalized population.

26 27 **DISCUSSION**

28
29 In this work, we defined and benchmark results from three key variables related to
30 COVID research using CPRD: index COVID diagnoses, COVID vaccinations, and
31 persons at high risk of severe disease.
32
33
34
35

36 We identified 2,271,072 COVID cases in CPRD Aurum between 1 August 2020 through
37 31 January 2022. Younger age and lower socioeconomic deprivation have been
38 consistently associated with reductions in COVID incidence and severity.^{27,28} These
39 factors may explain why this CPRD cohort, which proportionally underrepresented
40 persons age 65 and older and overrepresented persons living in the regions with higher
41 median total household wealth, captured 15% of COVID cases in a database that
42 covers 24% of persons in England. Future work using CPRD for COVID research will
43 need to consider these limitations of under ascertainment of cases. Moving beyond this
44 study's time period, the transition to at home testing, as well as the end of free PCR
45 testing for the general public on April 1, 2022, will need to be additionally considered.

3 COVID vaccination events were well captured in the CPRD. This stands in stark
4 contrast to most administrative claims and EHR databases in the United States, where
5 less than 50% of COVID vaccines are recorded in comparison to estimates provided by
6 the Centers for Disease Control and Prevention.^{29,30} England's national healthcare
7 system, as well as the NHS data infrastructure to facilitate capture of COVID-related
8 events and longstanding structure of general practitioners as the central node in a
9 person's healthcare coordination, enabled the high coverage of COVID vaccination
10 records. Researchers can be more confident with CPRD data that the absence of a
11 vaccination record indicates unvaccinated status than they otherwise would be with
12 most other real-world datasets, which is a critical consideration for studies related to
13 COVID disease burden, vaccination, or treatments.

24 The proportion of persons who had completed primary series vaccination prior to
25 infection was low among primary care cases. Notably, among hospitalized cases, no
26 patients had completed a primary COVID vaccination series. These findings may be
27 explained by several factors. First, the COVID vaccine was first made available in
28 England on 8 December 2020, and initially second doses were given up to 12 weeks
29 later to maximize limited supply for as many people as possible. Therefore, the calendar
30 period under study allowed for many persons to have had a COVID diagnosis in periods
31 at which "full vaccination" was not achievable. Second, it is possible that one vaccine
32 offered protection against severe illness.³¹⁻³³

41 We operationalized a total of over 28,000 codes, from an initial set of nearly 50,000, for
42 three definitions of persons at risk of severe disease. We have made the search terms
43 available, for reproducibility, as well as the resulting code lists, for other research
44 groups to implement in their work.
45
46
47
48
49

50 While there are similarities between the three definitions, differences do exist. In the
51 example of renal disease, NHS Highest Risk defines as chronic kidney disease stage 4
52 or 5, PANORAMIC trial criteria stipulate stage 2 or 3, and UKHSA Clinical Risk are for
53 stages 3-5. PANORAMIC trial eligibility capture persons with mild renal disease, as
54
55
56
57
58

1
2
3 some antiviral treatments are not approved for use in persons with severe renal
4 disease. However, UKHSA Clinical Risk prioritized vaccination access for persons at
5 highest risk of disease, which would include persons with more advanced renal disease.
6
7 Notably, persons who have renal disease as defined by PANORAMIC trial criteria by
8 definition do not have renal disease by NHS definition, and people in each of these may
9 (or may not) meet UKHSA prioritization. The choice of which high risk definition to
10 implement in future studies will need to be guided by the study population and research
11 question.
12
13
14

18 In the primary care cases, persons at high risk were older, more often smokers, had
19 larger body sizes, and higher Charlson Comorbidity Indices from the overall group of
20 primary care cases. Among hospitalized cases, the high-risk groups were similar to the
21 entire hospitalized group. These findings are consistent with existing understanding of
22 high-risk definitions, and perhaps provide reassurance that the code lists measure the
23 purported phenomenon.

30
31 The study periods in this report represent the most recent data available from CPRD as
32 of 22 March 2023. During the Autumn of 2022, the Aurum database experienced data
33 quality issues related to the EMIS data flows from legacy systems, and no primary care
34 data have been made available to researchers since the May 2022 release (data
35 through March 2022, with some early view of April 2022). Separately, HES secondary
36 care data have not been updated since March 2021, as NHS Digital has undergone a
37 change in the way they process and link data. COVID remains a serious disease for
38 some people, and it is certain that some of the 1.7 million persons diagnosed with
39 COVID after April 1, 2021 would have been later admitted for COVID, but we do not
40 have the hospital admission data to distinguish them from those whose cases were
41 managed entirely in the community setting. Throughout, we have used the term
42 “primary care records” as the combined groups of those known to be non-hospitalized
43 (cases where HES data were available, but the person was not hospitalized), as well as
44 those who we have GP encounters for but unknown eventual hospital admission status.
45 It is difficult to approximate the number of hospital admissions that would be expected

3 with full data availability. Carrying forward the 2% hospital admission incidence seen in
4 the early pandemic period may not be appropriate, given 2021 introduced periods of
5 increased (delta variant) and decreased (omicron variant) risk of hospital admission, as
6 well the uptake of COVID vaccinations and antiviral treatments. Finally, the population
7 structure of this cohort outlined in this work further challenge the direct application of
8 national estimates to CPRD cohorts.
9
10
11
12
13

14
15 The present study does not capture persons not under GP care such as prisoners,
16 some residential homes, and persons without a place of residence. Additionally, CPRD
17 Aurum, when linked with HES data, reduces the population to persons registered at
18 eligible GP practices in England and therefore may not represent persons in other
19 countries in the UK, or countries outside the UK. This study does not include persons
20 who presented directly to hospital without any prior GP interaction. In particular, persons
21 with more severe disease such as older adults may require immediate hospital
22 admission before seeking primary care, which could explain some of the gaps in
23 representation we have reported. Given that CPRD is a primary care database, and the
24 limited time period of hospital data availability, we decided to design our study as an
25 initial cohort of persons with primary care records of COVID. Studies looking for
26 complete capture of all hospitalized COVID patients might consider other data sources.

37
38 In conclusion, we present a cohort of over 2 million COVID cases in linked CPRD-HES
39 data, using published definitions for COVID cases, vaccinations, and each of three UK-
40 specific definitions of persons at high risk of severe disease. CPRD primary care data is
41 a robust real-world data source and can be used for some COVID research questions;
42 however, limitations of the data availability should be carefully considered.

Persons of any age diagnosed with COVID from August 1, 2020 through January 31, 2022 using the May 2022 CPRD Aurum data release.	2,631,267
Files of "acceptable research quality", as defined by CPRD.	2,631,267
Continuously registered with CPRD GP practice for at least 365 days prior to COVID diagnosis, and did not have a registration end date, practice last collection date or death date prior to COVID diagnosis.	2,322,875
Hospital Episode Statistics (HES) Admitted Patient Care (APC) linkage eligible.	2,289,708
Once ONS data were received, 42 persons were noted that should have been excluded from the final cohort because ONS death data preceded index date.	2,289,666
Excluded persons who were admitted to the hospital on or before their primary care recorded date of COVID diagnosis. Due to mandatory GP reporting guidelines, this may be lagged from the date of true test collection and therefore not accurately reflect date of diagnosis.	2,271,072

All CPRD Aurum patients refers figures published in "Data resource profile: Clinical Practice Research Datalink (CPRD) Aurum" by Wolf et al (International Journal of Epidemiology 2019). We were unable to find more recent distributions by ONS region of all CPRD Aurum patients.

For all COVID cases, coronavirus.data.gov.uk no longer publishes case counts by region at the day level. It was not possible to limit to the study period of August 1, 2020 – January 31, 2022, and therefore the results above reflect the figures as accessed on January 31, 2023 of the total number of cases since the start of the pandemic.

For the population of England, we used ONS 2021 Census figures.

ICD-10 code	Term
C00.0	Malignant neoplasm: External upper lip
C00.1	Malignant neoplasm: External lower lip
C00.2	Malignant neoplasm: External lip, unspecified
C00.3	Malignant neoplasm: Upper lip, inner aspect
C00.4	Malignant neoplasm: Lower lip, inner aspect
C00.5	Malignant neoplasm: Lip, unspecified, inner aspect
C00.6	Malignant neoplasm: Commissure of lip
C00.8	Malignant neoplasm: Overlapping lesion of lip
C00.9	Malignant neoplasm: Lip, unspecified
C01	Malignant neoplasm of base of tongue
C02.0	Malignant neoplasm: Dorsal surface of tongue
C02.1	Malignant neoplasm: Border of tongue
C02.2	Malignant neoplasm: Ventral surface of tongue
C02.3	Malignant neoplasm: Anterior two-thirds of tongue, part unspecified
C02.4	Malignant neoplasm: Lingual tonsil
C02.8	Malignant neoplasm: Overlapping lesion of tongue
C02.9	Malignant neoplasm: Tongue, unspecified
C03.0	Malignant neoplasm: Upper gum
C03.1	Malignant neoplasm: Lower gum
C03.9	Malignant neoplasm: Gum, unspecified
C04.0	Malignant neoplasm: Anterior floor of mouth
C04.1	Malignant neoplasm: Lateral floor of mouth
C04.8	Malignant neoplasm: Overlapping lesion of floor of mouth
C04.9	Malignant neoplasm: Floor of mouth, unspecified
C05.0	Malignant neoplasm: Hard palate
C05.1	Malignant neoplasm: Soft palate
C05.2	Malignant neoplasm: Uvula
C05.8	Malignant neoplasm: Overlapping lesion of palate
C05.9	Malignant neoplasm: Palate, unspecified
C06.0	Malignant neoplasm: Cheek mucosa
C06.1	Malignant neoplasm: Vestibule of mouth
C06.2	Malignant neoplasm: Retromolar area
C06.8	Malignant neoplasm: Overlapping lesion of other and unspecified parts of mouth
C06.9	Malignant neoplasm: Mouth, unspecified
C07	Malignant neoplasm of parotid gland
C08.0	Malignant neoplasm: Submandibular gland
C08.1	Malignant neoplasm: Sublingual gland
C08.8	Malignant neoplasm: Overlapping lesion of major salivary glands
C08.9	Malignant neoplasm: Major salivary gland, unspecified
C09.0	Malignant neoplasm: Tonsillar fossa
C09.1	Malignant neoplasm: Tonsillar pillar (anterior)(posterior)
C09.8	Malignant neoplasm: Overlapping lesion of tonsil
C09.9	Malignant neoplasm: Tonsil, unspecified
C10.0	Malignant neoplasm: Vallecula
C10.1	Malignant neoplasm: Anterior surface of epiglottis
C10.2	Malignant neoplasm: Lateral wall of oropharynx

ICD-10 code Term

G35	Multiple sclerosis
G12.2	Motor neuron disease
G12.20	Motor neuron disease - Unspecified
G12.21	Motor neuron disease - Amyotrophic lateral sclerosis
G12.22	Motor neuron disease - Progressive bulbar palsy
G12.23	Motor neuron disease - Primary lateral sclerosis
G12.24	Motor neuron disease - Familial motor neuron disease
G12.25	Motor neuron disease - Progressive spinal muscle atrophy
G12.29	Motor neuron disease - Other motor neuron disease
G70.0	Myasthenia gravis
G70.00	Myasthenia gravis - without (acute) exacerbation
G70.01	Myasthenia gravis - with (acute) exacerbation
G10	Huntington's disease

1 Andersen et al (2023)

2 Inclusion criteria as in PANORAMIC protocol

3 Chronic respiratory disease (including chronic obstructive pulmonary disease (COPD), cystic fibrosis and
4 asthma requiring at least daily use of preventative and/or reliever medication)

5 Chronic heart or vascular diseases

6 Renal disease: mild kidney disease (CKD) stage 2 and 3, with an eGFR measurement in the past 6 months

7 Chronic liver disease

8 Chronic neurological disease (including dementia, stroke, epilepsy)

9 Severe and profound learning disability

10 Down's syndrome

11 Diabetes mellitus (Type I or Type II)

12 present at birth and diagnosed in childhood) or secondary due to disease or treatment (e.g., sickle cell, HIV,
13 cancer, chemotherapy)

14 Solid organ, bone marrow and stem cell transplant recipients

15 Morbid obesity (BMI > 35)

16 Severe mental illness

17 Community and care home resident

18 Description of sheet abbreviations:

19 pan_ to reflect PANORAMIC trial criteria code list

20 _XX_ to reflect the concept

21 __m to reflect medcodeid, _icd to reflect ICD-10 codes, _p to reflect procodeid or _opcs to reflect OPCS procodeid

22 Format of sheets:

23 medcodeid and procodeid are stored as text, not integers, as per CPRD suggestions.

32 Chronic rejection of pancreas transplant
33 Doppler ultrasonography of blood vessel of organ transplant
34 Accelerated coronary artery disease in transplanted heart
35 [V]Liver transplanted
36 Examination of recipient after kidney transplant
37 Heterotopic liver transplant
38 Fluoroscopic angiography of renal transplant
39 Fluoroscopy guided insertion of nephrostomy tube into transplanted kidney
40 Recurrent post-transplant renal disease
41 Removal of nephrostomy tube from transplanted kidney using fluoroscopic guidance
42 Solid organ transplant
43 End stage renal failure with renal transplant
44 Doppler ultrasonography of transplanted kidney
45 Radioisotope hepatobiliary function study with stimulation post transplant
46 Fluoroscopic venogram of transplanted pancreas using contrast
47 Post-transplant neoplasia
48 Transplanted heart present
49 Corneal transplant
50 Moderate chronic transplant nephropathy

1 Transplantation of islet cells
2 Piggy-back heart transplant
3 Heart-lung transplant with recipient cardiectomy-pneumonectomy
4 Heart and lung transplant
5 Removal of transplanted kidney
6 [V]Lung transplanted
7 Organ transplant with complication
8 Other specified transplantation of lung
9 Transplantation of lung NOS
10 Other specified transplantation of heart and lung
11 Aneurysm of vein of transplanted kidney
12 Thrombosis of vein of transplanted kidney
13 Antegrade insertion of ureteric stent into ureter of transplanted kidney using fluoroscopic guidance

ICD-10 code	Term
F72.0	Severe mental retardation with the statement of no, or minimal, impairment of behaviour
F72.1	Severe mental retardation significant impairment of behaviour requiring attention or treatment
F72.8	Severe mental retardation other impairments of behaviour
F72.9	Severe mental retardation without mention of impairment of behaviour
F73.0	Profound mental retardation with the statement of no, or minimal, impairment of behaviour
F73.1	Profound mental retardation significant impairment of behaviour requiring attention or treatment
F73.8	Profound mental retardation other impairments of behaviour
F73.9	Profound mental retardation without mention of impairment of behaviour
F78.1	Other mental retardation significant impairment of behaviour requiring attention or treatment
F80.3	Acquired aphasia with epilepsy [Landau-Kleffner]
F84.2	Rett syndrome
F84.3	Other childhood disintegrative disorder
Q90.0	Trisomy 21, meiotic nondisjunction
Q90.1	Trisomy 21, mosaicism (mitotic nondisjunction)
Q90.2	Trisomy 21, translocation
Q90.9	Down syndrome, unspecified
Q91.0	Trisomy 18, meiotic nondisjunction
Q91.1	Trisomy 18, mosaicism (mitotic nondisjunction)
Q91.2	Trisomy 18, translocation
Q91.3	Edwards syndrome, unspecified
Q91.4	Trisomy 13, meiotic nondisjunction
Q91.5	Trisomy 13, mosaicism (mitotic nondisjunction)
Q91.6	Trisomy 13, translocation
Q91.7	Patau syndrome, unspecified
Q92.0	Whole chromosome trisomy, meiotic nondisjunction
Q92.1	Whole chromosome trisomy, mosaicism (mitotic nondisjunction)
Q92.2	Major partial trisomy
Q92.3	Minor partial trisomy
Q92.7	Triploidy and polyploidy
Q92.8	Other specified trisomies and partial trisomies of autosomes
Q92.9	Trisomy and partial trisomy of autosomes, unspecified
Q93.3	Deletion of short arm of chromosome 4
Q93.4	Deletion of short arm of chromosome 5
Q93.5	Other deletions of part of a chromosome
Q93.6	Deletions seen only at prometaphase
Q93.7	Deletions with other complex rearrangements
Q93.8	Other deletions from the autosomes
Q93.9	Deletion from autosomes, unspecified
Q95.2	Balanced autosomal rearrangement in abnormal individual
Q95.3	Balanced sex/autosomal rearrangement in abnormal individual
Q90.0	Trisomy 21, meiotic nondisjunction
Q90.1	Trisomy 21, mosaicism (mitotic nondisjunction)
Q90.2	Trisomy 21, translocation
Q90.9	Down syndrome, unspecified
G35	Multiple sclerosis
G40.3	Generalized idiopathic epilepsy and epileptic syndromes
G40.4	Other generalized epilepsy and epileptic syndromes
G40.5	Special epileptic syndromes
G40.6	Grand mal seizures, unspecified (with or without petit mal)

1		
2	G40.7	Petit mal, unspecified, without grand mal seizures
3	G40.8	Other epilepsy
4	G40.9	Epilepsy, unspecified
5	G41.0	Grand mal status epilepticus
6	G41.1	Petit mal status epilepticus
7	G41.2	Complex partial status epilepticus
8	G41.8	Other status epilepticus
9	G41.9	Status epilepticus, unspecified
10	G46.3	Brain stem stroke syndrome
11	I63	Cerebral infarction
12	I63.0	Cerebral infarction due to thrombosis of precerebral arteries
13	I63.1	Cerebral infarction due to embolism of precerebral arteries
14	I63.2	Cerebral infarction due to unspecified occlusion or stenosis of precerebral arteries
15	I63.3	Cerebral infarction due to thrombosis of cerebral arteries
16	I63.4	Cerebral infarction due to embolism of cerebral arteries
17	I63.5	Cerebral infarction due to unspecified occlusion or stenosis of cerebral arteries
18	I63.6	Cerebral infarction due to cerebral venous thrombosis, nonpyogenic
19	I63.8	Other cerebral infarction
20	I63.9	Cerebral infarction, unspecified
21	I64	Stroke, not specified as haemorrhage or infarction
22	G30.0	Alzheimer disease with early onset
23	G30.1	Alzheimer disease with late onset
24	G30.8	Other Alzheimer disease
25	G30.9	Alzheimer disease, unspecified
26	F00.0	Dementia in Alzheimer disease with early onset
27	F00.1	Dementia in Alzheimer disease with late onset
28	F00.2	Dementia in Alzheimer disease, atypical or mixed type
29	F00.9	Dementia in Alzheimer disease, unspecified
30	F01.0	Vascular dementia of acute onset
31	F01.1	Multi-infarct dementia
32	F01.2	Subcortical vascular dementia
33	F01.3	Mixed cortical and subcortical vascular dementia
34	F01.8	Other vascular dementia
35	F01.9	Vascular dementia, unspecified
36	F02.0	Dementia in Pick disease
37	F02.1	Dementia in Creutzfeldt-Jakob disease
38	F02.2	Dementia in Huntington disease
39	F02.3	Dementia in Parkinson disease
40	F02.4	Dementia in human immunodeficiency virus [HIV] disease
41	F02.8	Dementia in other specified diseases classified elsewhere
42	F03	Unspecified dementia
43	F04	Organic amnesic syndrome, not induced by alcohol and other psychoactive substances
44	F05.0	Delirium not superimposed on dementia, so described
45	F05.1	Delirium superimposed on dementia
46	G12.2	Motor neuron disease
47	G12.20	Motor neuron disease - Unspecified
48	G12.21	Motor neuron disease - Amyotrophic lateral sclerosis
49	G12.22	Motor neuron disease - Progressive bulbar palsy
50	G12.23	Motor neuron disease - Primary lateral sclerosis
51	G12.24	Motor neuron disease - Familial motor neuron disease

1		
2	G12.25	Motor neuron disease - Progressive spinal muscle atrophy
3	G12.29	Motor neuron disease - Other motor neuron disease
4	G20	Parkinson Disease
5	G21.1	Other drug-induced secondary parkinsonism
6	G21.2	Secondary parkinsonism due to other external agents
7	G21.3	Postencephalitic parkinsonism
8	G21.4	Vascular parkinsonism
9	G21.8	Other secondary parkinsonism
10	G21.9	Secondary parkinsonism, unspecified
11		
12	G80	Cerebral Palsy
13	G80.0	Spastic quadriplegic cerebral palsy
14	G80.1	Spastic diplegic cerebral palsy
15	G80.2	Spastic hemiplegic cerebral palsy
16	G80.3	Dyskinetic cerebral palsy
17	G80.4	Ataxic cerebral palsy
18	G80.8	Other cerebral palsy

STROBE Statement—Checklist of items that should be included in reports of *cohort studies*

Andersen et al (2023): Persons Diagnosed with COVID in England in the Clinical Practice Research Datalink (CPRD): A Cohort Description

	Item No	Recommendation	Page No
Title and abstract	1	(a) Indicate the study's design with a commonly used term in the title or the abstract	1
		(b) Provide in the abstract an informative and balanced summary of what was done and what was found	2-3
Introduction			
Background/rationale	2	Explain the scientific background and rationale for the investigation being reported	4
Objectives	3	State specific objectives, including any prespecified hypotheses	4
Methods			
Study design	4	Present key elements of study design early in the paper	5
Setting	5	Describe the setting, locations, and relevant dates, including periods of recruitment, exposure, follow-up, and data collection	5
Participants	6	(a) Give the eligibility criteria, and the sources and methods of selection of participants. Describe methods of follow-up	5
		(b) For matched studies, give matching criteria and number of exposed and unexposed	N/A
Variables	7	Clearly define all outcomes, exposures, predictors, potential confounders, and effect modifiers. Give diagnostic criteria, if applicable	6-9
Data sources/ measurement	8*	For each variable of interest, give sources of data and details of methods of assessment (measurement). Describe comparability of assessment methods if there is more than one group	6-9
Bias	9	Describe any efforts to address potential sources of bias	6-9
Study size	10	Explain how the study size was arrived at	5
Quantitative variables	11	Explain how quantitative variables were handled in the analyses. If applicable, describe which groupings were chosen and why	9
Statistical methods	12	(a) Describe all statistical methods, including those used to control for confounding	9
		(b) Describe any methods used to examine subgroups and interactions	9
		(c) Explain how missing data were addressed	7, 9
		(d) If applicable, explain how loss to follow-up was addressed	N/A
		(e) Describe any sensitivity analyses	N/A
Results			
Participants	13*	(a) Report numbers of individuals at each stage of study—eg numbers potentially eligible, examined for eligibility, confirmed eligible, included in the study, completing follow-up, and analysed	eTable 6
		(b) Give reasons for non-participation at each stage	eTable 6
		(c) Consider use of a flow diagram	eTable 6
Descriptive data	14*	(a) Give characteristics of study participants (eg demographic, clinical, social) and information on exposures and potential confounders	10-11

		(b) Indicate number of participants with missing data for each variable of interest	Shown in every table
		(c) Summarise follow-up time (eg, average and total amount)	N/A
Outcome data	15*	Report numbers of outcome events or summary measures over time	11
Main results	16	(a) Give unadjusted estimates and, if applicable, confounder-adjusted estimates and their precision (eg, 95% confidence interval). Make clear which confounders were adjusted for and why they were included (b) Report category boundaries when continuous variables were categorized (c) If relevant, consider translating estimates of relative risk into absolute risk for a meaningful time period	N/A N/A N/A
Other analyses	17	Report other analyses done—eg analyses of subgroups and interactions, and sensitivity analyses	N/A
Discussion			
Key results	18	Summarise key results with reference to study objectives	12-13
Limitations	19	Discuss limitations of the study, taking into account sources of potential bias or imprecision. Discuss both direction and magnitude of any potential bias	14-15
Interpretation	20	Give a cautious overall interpretation of results considering objectives, limitations, multiplicity of analyses, results from similar studies, and other relevant evidence	15-16
Generalisability	21	Discuss the generalisability (external validity) of the study results	12-13
Other information			
Funding	22	Give the source of funding and the role of the funders for the present study and, if applicable, for the original study on which the present article is based	18

*Give information separately for exposed and unexposed groups.

Note: An Explanation and Elaboration article discusses each checklist item and gives methodological background and published examples of transparent reporting. ABSTRACT (347/400 words)

Objective: To create case definitions for confirmed COVID-19 diagnoses, COVID-19 vaccination status, and three separate definitions of high risk of severe COVID-19, as well as to assess whether the implementation of these definitions in a cohort reflected the sociodemographic and clinical characteristics of COVID-19 epidemiology in England.

Design: Retrospective cohort study

Setting: Electronic healthcare records from primary care (Clinical Practice Research Datalink, or CPRD) linked to secondary care data (Hospital Episode Statistics, or HES) data covering 24% of the population in England

Participants: 2,271,072 persons aged 1 year and older diagnosed with COVID-19 in CPRD Aurum between August 1, 2020 through January 31, 2022.

Main Outcome Measures: Age, sex, and regional distribution of COVID-19 cases and COVID-19 vaccine doses received prior to diagnosis were assessed separately for the cohorts of cases identified in primary care and those hospitalized for COVID-19 (primary diagnosis code of ICD-10 U07.1 "COVID-19"). Smoking status, body mass index and Charlson Comorbidity Index were compared for the two cohorts, as well as for three separate definitions of high risk of severe disease used in the United Kingdom (NHS Highest Risk, PANORAMIC trial eligibility, UK Health Security Agency Clinical Risk prioritization for vaccination).

Results: Compared to national estimates, CPRD case estimates underrepresented older adults in both the primary care (age 65-84: 6% in CPRD vs 9% nationally) and hospitalized (31% vs 40%) cohorts, and overrepresented people living in regions with the highest median wealth areas of England (20% primary care and 20% hospital admitted cases in South East, vs 15% nationally). The majority of non-hospitalized cases and all hospitalized cases had not completed primary series vaccination. In primary care, persons meeting high risk definitions were older, more often smokers, overweight or obese, and had higher Charlson Comorbidity Index score.

Conclusions: CPRD primary care data is a robust real-world data source and can be used for some COVID-19 research questions, however limitations of the data availability should be carefully considered. Included in this publication are supplemental files for a

8 **STRENGTHS AND LIMITATIONS OF THIS STUDY**

9

- 10 • Definitions were built using reproducible methods with independent local clinician
11 review and can be leveraged for future work.
- 12 • Results were compared to government published COVID-19 case and
13 vaccination counts and were found to be similar, which demonstrates external
14 validity of this data source.
- 15 • Limitations of the data include data recency lag, with primary care data ending in
16 April 2022 and hospitalization data ending in March 2021.
- 17 • Owing to the primary care setting of the data, this study does not represent
18 people without a general practitioner, or those who presented directly to hospital
19 without a prior COVID-19-related primary care encounter.

INTRODUCTION

As of 3 February 2023, there have been over 20 million confirmed COVID-19 cases and more than 183,000 related deaths in England.[1] COVID-19 severity ranges from asymptomatic cases to severe disease requiring hospital admission and sometimes death, with older adults and people with chronic health conditions at disproportionate risk.[2,3] Therefore, electronic health records (EHR) with longstanding capture of patients' medical history are uniquely positioned to answer population-based questions related to healthcare resource utilization, economic impact, and pharmaceutical intervention associated with COVID-19.

The Clinical Practice Research Datalink (CPRD) is a longitudinal and anonymized EHR database of primary health care interactions in England.[4] Primary care is the cornerstone of healthcare in England, with over 98% of the population registered with a general practitioner (GP). From August 2020 through March 2022, all tests booked via the National Health Service (NHS) website for polymerase chain reaction (PCR) tests for SARS-CoV-2, regardless of result, were reported to GP offices that use the EMIS electronic health record software.[5] Similarly, COVID-19 vaccines administered at any location in the country were also mandated to be reported to patient's GP.[6] Thus, during this period, CPRD can be considered a closed network of confirmed COVID-19 cases for persons in the network, with accurate information on COVID-19 vaccination status.

While the CPRD has been used in over 3,000 peer-reviewed publications, it is not known whether interruptions in healthcare, particularly in-person primary care visits, during the first years of the coronavirus pandemic affected the previously described characteristics of the CPRD population. The objective of this study was to create case definitions for COVID-19 diagnoses, COVID-19 vaccination, and three separate definitions of high risk of severe COVID-19. Second, we aimed to evaluate these definitions in a sample of persons with COVID-19, using the CPRD, to assess whether this cohort's sociodemographic and clinical characteristics were generalizable to

4 study can be leveraged in future COVID-19 research in CPRD data.

8 **METHODS**

9 **Study Setting and Population**

10 CPRD Aurum contains data which is routinely collected from primary care practices that
11 use the EMIS Web® digital clinical system that includes electronic patient records.[7]
12 The May 2022 release of CPRD Aurum contained data from approximately 24% of
13 persons in England.[8,9] Data captured include age, sex, body weight, medical
14 diagnoses, referrals to specialists and/or secondary care, prescriptions issued in
15 primary care, laboratory tests, vaccinations administered, smoking and alcohol
16 consumption status, and all other types of care delivered as part of routine primary care
17 practice.

27 CPRD Aurum was linked to Hospital Episode Statistics Admitted Patient Care (HES
28 APC) records, using deterministic patient-level linkage with an 8-stage algorithm carried
29 out by NHS Digital. Over 99% of practices contributing to CPRD Aurum participate in
30 HES linkage. The HES APC dataset includes patient demographics, date and method of
31 hospital admission and discharge, diagnoses, specialty care, and procedures. HES
32 APC data from April 1997 to March 2021 was available in this study.

40 **Inclusion and Exclusion Criteria**

41 We included persons of any age diagnosed with COVID-19 (described below) from 1
42 August 2020 through 31 January 2022. First, we required records to be of acceptable
43 research quality, as defined by CPRD. Second, we required people to be continuously
44 registered with their GP practice for at least 365 days prior to COVID-19 diagnosis, to
45 establish pre-COVID-19 health history. Third, we required persons to be HES APC
46 linkage eligible to ensure the exclusion of patients where confirmed hospital admission
47 status (via HES APC, during the time period available) could not be known. Fourth, we
48 excluded persons who were admitted to the hospital with a primary diagnosis of U07.1
49 on or before their primary care recorded date of COVID-19 diagnosis. Due to mandatory

10 11 12 **COVID-19 Case Definition**

13 With each monthly data release, CPRD publishes feasibility counts for SARS-CoV-2
14 related codes in CPRD primary care data with corresponding code lists.[8,10] The code
15 types include vaccination, tests (including PCR, antibody and antigen tests), diagnosis,
16 advice, possible cases, and post-COVID-19 clinic referral codes. Three reviewers (KA,
17 QM, AS) independently screened the CPRD code list to determine which of the codes
18 represented a confirmed and current infection. Discrepancies were adjudicated by a
19 fourth reviewer (LM), and the final definition for the COVID-19 case definition was
20 reviewed by UK and non-UK clinicians (**Supplemental file 1, Table 1**). We defined a
21 current and confirmed COVID-19 episode as a diagnosis code, positive PCR, or antigen
22 test. We did not include COVID-19 vaccination, antibody tests, possible cases,
23 exposure to COVID-19 or post-COVID-19 clinic referral codes in the COVID-19 case
24 definition.

36 Hospitalizations for COVID-19 were defined as persons admitted with a primary
37 diagnosis of COVID-19 (ICD-10 U07.1 "COVID-19") within 12 weeks of the initial
38 diagnosis recorded in primary care. Non-hospitalized COVID-19 cases were defined as
39 the subset of persons for whom secondary care data were available but had no record
40 of hospital admission. Primary care COVID-19 cases were defined as persons who
41 were not admitted to the hospital within 12 weeks of diagnosis, and those after April 1,
42 2021 for which hospital admission data were not available.

53 The first COVID-19 vaccine dose in England was administered on 8 December 2020,
54 with the initially limited supply prioritized for groups as outlined by the Joint Committee
55 for Vaccinations and Immunisations (JCVI).[11] In England, COVID-19 vaccines

3 produced by Pfizer-BioNTech and Moderna have been available since December 2020.
4 In April 2021, JCVI announced that persons who received a first dose of an
5 AstraZeneca vaccine would receive a second dose of the same brand but persons who
6 had not yet received a vaccine dose would be “preferentially offered an alternative”.^[12]
7 This study did not consider Novavax vaccinations, as it was approved for use after our
8 index date, or the Janssen or Valneva vaccines, which have not been used in England
9 as of February 2023.^[13]

17 In Phase 1 (December 2020 - March 2021), people aged 50 and older, as well as front-
18 line health and social care workers, clinically extremely vulnerable persons and persons
19 aged 16 and older with underlying health conditions were eligible to receive two doses.
20 In Phase 2 (beginning April 2021), access broadened for persons aged 18-49 to receive
21 two doses. Additionally, immunocompromised persons who received two doses in
22 phase 1 were recommended to receive a third dose at least eight weeks after their
23 second dose in order to complete their primary series. Phase 3 included a single dose
24 for 16–17-year-olds in August 2021. In September 2021, 12–15-year-olds could receive
25 a single dose and a booster dose for adults was recommended at least 6 months after
26 the completion of a primary series. In November 2021, 12–17-year-olds could receive a
27 second dose, and the recommendation for booster dose was shortened to at least 3
28 months after the completion of a primary series.^[11]

39 We used a combination of product codes, which specify brand and dose of vaccine, as
40 well as medical codes which indicated administration of a non-specific COVID-19
41 vaccine (**Supplemental file 1, Table 2**). The code lists were derived from the published
42 set by CPRD.^[10] While patients may have multiple vaccination codes in their record on
43 a given day, such as a code to indicate both the administration as well as a separate
44 code for the specific product given, persons were not counted as receiving as more than
45 one vaccine dose per day.

3 Persons were considered unvaccinated if there was no record of COVID-19 vaccination,
4 or for up to 13 days after first dose to account for time needed to build immunity
5 following immunisation. Dose 1 was defined starting 14 days after the record of the first
6 COVID-19 vaccine administration until 13 days after the receipt of second dose, or until
7 end of follow-up. Dose 2 was defined starting 14 days after the record of the second
8 COVID-19 vaccine administration and administered at least 21 days after the first dose.
9 Persons were considered to have had 2 doses until 13 days before their next vaccine.
10 For non-immunocompromised persons, the primary vaccination series was complete 14
11 days after second dose. For immunocompromised persons only, dose 3 was part of
12 their primary series at least 21 days after their second dose. First booster doses (winter
13 2021) were defined 21 or more days after the receipt of the last dose in primary series.
14 For all vaccination definitions, no upper limit on time between doses was applied.

26 **COVID-19 Risk Status**

27 We considered three separate definitions of COVID-19 risk status, each of which are set
28 forth by different groups and capture non-intersecting populations. First, the NHS
29 highest risk group, which was a list of conditions set forth by an advisory group
30 commissioned by England's Deputy Chief Medical Officer to identify persons at the very
31 highest risk of COVID-19 hospital admission and death.[14] Second, eligibility for the
32 PANORAMIC study, which began in December 2021 and is a platform randomized trial
33 of antiviral therapeutic agents.[15] The persons who qualify for antiviral treatment in the
34 trial are those at a higher risk of hospital admission and death. Third, UK Health
35 Security Agency (UKHSA) clinical risk groups as outlined in "The Green Book" chapter
36 14a, which is COVID-19 vaccination prioritization from the JCVI.[16] For each of these
37 three risk definitions, we operationalized the clinical conditions lists into SNOMED and
38 ICD-10 code lists. Where available, we used published code lists.[17–23] For concepts
39 not found in the literature, we developed wildcard-based search terms in the CPRD
40 code browser (**Supplemental file 1, Tables 3-5**). At least one practicing clinician from
41 the UK, who were independent and external to Pfizer, reviewed each of the search term
42 strategies, as well as ensuing code lists.

Comparison to Publicly Available Data

We compared our results to estimates published on the UK Government's Coronavirus dashboard, and restricted results to those specific to England, as the CPRD Aurum population that is HES-linkage eligible contains data from England only.[24,25] The data in this manuscript reflect figures from the dashboard as accessed on 31 January 2023. Where possible, we restricted the dashboard to cases from 1 August 2020 through 31 January 2022 to reflect the study period, although age, sex and region-specific estimates were reported "since the start of the pandemic".[24,25] For whole country (non-COVID-19 related) comparisons, we used the Office of National Statistics' 2021 Census.[9]

Statistical Analyses

All results are presented separately for the cohorts of persons with primary care versus hospitalized COVID-19 cases. Continuous variables are presented as means (standard deviations) or medians (interquartile ranges) and categorical variables as counts (percentages). Missing data for sex, region, smoking status and BMI is shown in tables. The absence of codes for comorbidities was assumed to be the absence of the comorbidity rather than missing data. Standardized mean differences (SMD) were used to compare groups, with SMD > 10% indicating significant difference. As per CPRD privacy rules, any cell with 10 persons or fewer (but not zero) was suppressed and other cells related to the small cell count were redacted to ensure no back-calculation could populate the count.

Data management and analyses for this study used SAS, version 9.4 (SAS Institute, Cary, North Carolina).

RESULTS

1
2
3 From 1 August 2020 through 31 January 2022, the UK Government's Coronavirus
4 dashboard reported 14,744,991 COVID-19 cases in England.[24] The final CPRD
5 cohort contained 2,271,072 persons diagnosed with COVID-19, regardless of care
6 setting, in England in the same time period (**Supplemental file 1, Table 6**). The case
7 trends followed national estimates, with a series of peaks and troughs with a large peak
8 in winter 2021 (**Supplemental file 1, Figures 1 and 2**). Hospital admissions increased
9 in fall 2020 and winter 2020 (**Supplemental file 1, Figure 3**).

10
11
12
13
14
15
16
17 There were 2,257,907 persons with COVID-19 cases observed in primary care, which
18 included persons who were not hospitalized during the period of time for which hospital
19 admission data was available (n=522,288) as well as all COVID-19 diagnoses recorded
20 in the period where hospital admission data ended (n=1,735,619). Separately, there
21 were 13,165 persons (2% of COVID-19 cases from August 2020 to March 2021) who
22 were hospitalized within 12 weeks of initial COVID-19 diagnosis with a primary
23 diagnosis of COVID-19 (**Figure 1**).

30 31 **Characteristics of COVID-19 Cases**

32 For both primary care and hospitalized cases, the majority of persons with COVID-19 in
33 CPRD were adults aged 18-64 (**Table 1**). The age distribution of CPRD primary care
34 cases generally followed the national case count distribution, with young and middle-
35 aged adults representing the largest groups, as well as the largest fraction of the
36 English population (**Supplemental file 1, Table 7**). Older adults were underrepresented
37 in both cohorts as compared to national population estimates. Within the primary care
38 cohort, 6% of patients were aged 65-84 years, whereas 9% of national COVID-19 cases
39 occurred in this age group. Notable differences were observed in the hospitalized cohort
40 when compared to the national estimates; 31% vs. 40% were aged 65 - 84 years, and
41 8% vs. 21% aged ≥ 85 years, respectively.

51 The sex distribution of COVID-19 cases in the primary care cohort was comparable to
52 national estimates, with 55% female in each (**Table 1 and Supplemental file 1, Table**

1
2
3 **7)**. There were more males (57%) than females in the hospitalized cohort; there are no
4 national sex-specific hospital admission counts available.
5
6
7

8 The regional distributions of the CPRD primary care and hospitalized cohorts were
9 similar to each other, but not the overall country. Both of the study cohorts had larger
10 proportions of persons with GP practices in higher income regions of England as
11 compared to national case counts.[26] For example, 20% of persons in the primary care
12 cohort and 20% in the hospitalized cohort lived in South East region of England, the
13 region with the highest median total household wealth as reported in March 2020. This
14 is compared to 20% of CPRD contributing practices, 15% of all English cases and 16%
15 of the population lived in London (**Supplemental file 1, Table 8**). Similar trends are
16 seen with lower median total household wealth regions being proportionally
17 underrepresented in the COVID-19 CPRD cohort as compared to national case
18 estimates or population distribution.

29 **COVID-19 Vaccination Status**

30 At the time of COVID-19 diagnosis, 27% of non-immunocompromised persons and 36%
31 of immunocompromised persons had completed a primary series of COVID-19
32 vaccination (**Table 2**). Among the non-immunocompromised hospitalized COVID-19
33 cases, 98% were unvaccinated and none had completed a primary series. For
34 immunocompromised hospitalized COVID-19 cases, 56% were unvaccinated, 44% had
35 received one dose, and none had completed a primary series. As of 1 December 2021,
36 86% of adults had ≥ 1 and 80% had ≥ 2 COVID-19 vaccine doses (2% and 0.2% lower
37 than official reports, respectively).

46 **Populations at Risk of Severe Disease**

47 After wildcard searches, clinicians reviewed nearly 50,000 codes to set the definitions
48 for high-risk lists. The final lists contained 12,390 codes for NHS Highest Risk, 9,132
49 codes for PANORAMIC trial criteria and 7,343 codes for UKHSA Clinical Risk
50 (**Supplemental files 2-4**). In the primary care cohort, 11% met NHS Highest Risk, 31%
51 PANORAMIC, and 10% UKHSA Clinical Risk criteria (**Table 3**). With each definition,

3 primary care cohort cases at high risk were more often current smokers (ranging from
4 17-21% vs 13% in full cohort) or former smokers (24-28% vs 13%), overweight (16-
5 19%, vs 9%) or obese (20-28%, vs 10%), and a larger proportion had at least 1
6 comorbidity in the Charlson Index (29-54%, vs 11%), where this was recorded. Primary
7 care cases at high risk of severe disease were also older (mean age 49-55 years, vs 34
8 years), more often female (55-63%, vs 54%), and had more recorded vaccine doses
9 prior to COVID-19 diagnosis (**Supplemental file 1, Table 9**).

10
11
12 Among hospitalized COVID-19 cases, 33% met NHS Highest Risk, 84% PANORAMIC,
13 and 41% UKHSA Clinical Risk criteria's (**Supplemental file 1, Table 4**). The high risk
14 hospitalized groups were similar to the overall hospitalized cohort. Nearly half of
15 persons were current smokers (13-16%, vs 13%) or former smokers (32-39%, vs 29%),
16 and more than half were overweight (20-23%, vs 18%) or obese (37-42%, vs 35%).
17 Among the hospital admitted cohort, people meeting each high-risk definition were older
18 (mean age 65-66 years, vs 60 years) (**Supplemental file 1, Table 10**). Subgroups of
19 patients with the NHS and UKHSA definitions had higher mean Charlson Comorbidity
20 Indexes, and more females, than high risk patients identified with the PANORAMIC
21 criteria or the entire hospitalized population.

37 **Key Results**

38 In this work, we defined and benchmark results from three key variables related to
39 COVID-19 research using CPRD: index COVID-19 diagnoses, COVID-19 vaccinations,
40 and persons at high risk of severe disease.

48 We identified 2,271,072 COVID-19 cases in CPRD Aurum between 1 August 2020
49 through 31 January 2022. Younger age and lower socioeconomic deprivation have
50 been consistently associated with reductions in COVID-19 incidence and
51 severity.[27,28] These factors may explain why this CPRD cohort, which proportionally
52 underrepresented persons age 65 and older and overrepresented persons living in the

3 regions with higher median total household wealth, captured 15% of COVID-19 cases in
4 a database that covers 24% of persons in England. The requirement for an NHS
5 number in order for results to be shared may explain some of this attrition as well.
6
7 Future work using CPRD for COVID-19 research will need to consider these limitations
8
9 of under ascertainment of cases. Moving beyond this study's time period, the transition
10
11 to at home testing, as well as the end of free PCR testing for the general public on April
12
13 1, 2022, will need to be additionally considered.

16
17 This manuscript reports results from a case definition of confirmed and current infection.
18 We did not include codes for immunoglobulin titers, as measurable antibodies indicate a
19 resolved infection rather than date of onset. We did not include codes indicating a
20 sequela of prior infection, as these most often occur on a later date than index
21 diagnosis. We did not include codes indicating a test without a result, as people with a
22 negative test result should not be included in a COVID-19 case definition. Our results
23 therefore identified fewer cases, although with greater specificity, than other studies in
24 published literature that allow for such heterogeneity.[29]
25
26
27
28

30
31

32 COVID-19 vaccination events were well captured in the CPRD. This stands in stark
33 contrast to most administrative claims and EHR databases in the United States, where
34 less than 50% of COVID-19 vaccines are recorded in comparison to estimates provided
35 by the Centers for Disease Control and Prevention.[30,31] England's national
36 healthcare system, as well as the NHS data infrastructure to facilitate capture of
37 COVID-19-related events and longstanding structure of general practitioners as the
38 central node in a person's healthcare coordination, enabled the high coverage of
39 COVID-19 vaccination records. Researchers can be more confident with CPRD data
40 that the absence of a vaccination record indicates unvaccinated status than they
41 otherwise would be with most other real-world datasets, which is a critical consideration
42 for studies related to COVID-19 disease burden, vaccination, or treatments.

52
53 The proportion of persons who had completed primary series vaccination prior to

2
3 patients had completed a primary COVID-19 vaccination series. These findings may be
4 explained by several factors. First, the COVID-19 vaccine was first made available in
5 England on 8 December 2020, and initially second doses were given up to 12 weeks
6 later to maximize limited supply for as many people as possible. Therefore, the calendar
7 period under study allowed for most persons to have had a COVID-19 diagnosis in
8 periods at which “full vaccination” was not achievable. Second, it is possible that one
9 vaccine offered protection against severe illness.[32–34]

17 We operationalized a total of over 28,000 codes, from an initial set of nearly 50,000, for
18 three definitions of persons at risk of severe disease. We have made the search terms
19 available, for reproducibility, as well as the resulting code lists, for other research
20 groups to implement in their work. After the completion of this work, NHS Digital
21 published a code list for “Targeted Conditions”, which includes each element in the NHS
22 Highest Risk category. Among these, the NHS code list can be repurposed for 4 of the
23 14 conditions in PANORAMIC criteria and 3 of the 11 conditions in UKHSA Clinical
24 Risk. To our knowledge, we offer the first publication of code lists for capture of all
25 elements in the PANORAMIC criteria as well as UKHSA Clinical Risk criteria for these
26 high-risk definitions, which can now be readily used in datasets that contain CPRD
27 medical and product, ICD-10 and OPCS Classification of Interventions and Procedures
28 codes.

39 While there are similarities between the three definitions, differences do exist. In the
40 example of renal disease, NHS Highest Risk defines as chronic kidney disease stage 4
41 or 5, PANORAMIC trial criteria stipulate stage 2 or 3, and UKHSA Clinical Risk are for
42 stages 3-5. PANORAMIC trial eligibility capture persons with mild renal disease, as
43 some antiviral treatments are not approved for use in persons with severe renal
44 disease. However, UKHSA Clinical Risk prioritized vaccination access for persons at
45 highest risk of disease, which would include persons with more advanced renal disease.
46 Notably, persons who have renal disease as defined by PANORAMIC trial criteria by
47 definition do not have renal disease by NHS definition, and people in each of these may
48 (or may not) meet UKHSA prioritization. The choice of which high risk definition to

8 In the primary care cases, persons at high risk were older, more often smokers, had
9 larger body sizes, and higher Charlson Comorbidity Indices from the overall group of
10 primary care cases. Among hospitalized cases, the high-risk groups were similar to the
11 entire hospitalized group. These findings are consistent with existing understanding of
12 high-risk definitions, and perhaps provide reassurance that the code lists measure the
13 purported phenomenon.

20 The study periods in this report represent the most recent data available from CPRD as
21 of 3 February 2023. During the Autumn of 2022, the Aurum database experienced data
22 quality issues related to the EMIS data flows from legacy systems, and no primary care
23 data have been made available to researchers since the May 2022 release (data
24 through March 2022, with some early view of April 2022). Separately, HES secondary
25 care data have not been updated since March 2021, as NHS Digital has undergone a
26 change in the way they process and link data. COVID-19 remains a serious disease for
27 some people, and it is certain that some of the 1.7 million persons diagnosed with
28 COVID-19 after April 1, 2021 would have been later admitted for COVID-19, but we do
29 not have the hospital admission data to distinguish them from those whose cases were
30 managed entirely in the community setting. Throughout, we have used the term
31 “primary care records” as the combined groups of those known to be non-hospitalized
32 (cases where HES data were available, but the person was not hospitalized), as well as
33 those who we have GP encounters for but unknown eventual hospital admission status.
34 It is difficult to approximate the number of hospital admissions that would be expected
35 with full data availability. Carrying forward the 2% hospital admission incidence seen in
36 the early pandemic period may not be appropriate, given 2021 introduced periods of
37 increased (delta variant) and decreased (omicron variant) risk of hospital admission, as
38 well the uptake of COVID-19 vaccinations and antiviral treatments. Finally, the
39 population structure of this cohort outlined in this work further challenge the direct
40 application of national estimates to CPRD cohorts.

5 The present study does not capture persons not under GP care such as prisoners,
6 some residential homes, and persons without a place of residence. Additionally, CPRD
7 Aurum, when linked with HES data, reduces the population to persons registered at
8 eligible GP practices in England and therefore may not represent persons in other
9 countries in the UK, or countries outside the UK. This study does not include persons
10 who presented directly to hospital without any prior GP interaction. In particular, persons
11 with more severe disease such as older adults may require immediate hospital
12 admission before seeking primary care, which could explain some of the gaps in
13 representation we have reported. Given that CPRD is a primary care database, and the
14 limited time period of hospital data availability, we decided to design our study as an
15 initial cohort of persons with primary care records of COVID-19. Studies looking for
16 complete capture of all hospitalized COVID-19 patients might consider other data
17 sources.

29 **CONCLUSION**

30 In conclusion, we present a cohort of over 2 million COVID-19 cases in linked CPRD-
31 HES data, using published definitions for COVID-19 cases, vaccinations, and each of
32 three UK-specific definitions of persons at increased risk of severe disease. CPRD
33 primary care data is a robust real-world data source and can be used for COVID-19
34 related research questions; however, limitations of the data availability should be
35 carefully considered.

The authors gratefully acknowledge Bethany Backhouse, Poppy Payne, Elke Rottier and Robert Wood from Adelphi Real World (Bollington, UK), Tamuno Alfred, Darren Kailung Jeng, Tendai Mugwagwa, Qiao Mu and Chern Chuan Soo from Pfizer Inc. (New York, United States) Agnieszka Gajewska, Tomasz Mikołajczyk and Ewa Śleszyńska-Dopiera from Quanticate (Warsaw, Poland), and Andy Surinach from Genesis Research (Hoboken, United States).

Data Sharing Statement

Electronic health records are considered sensitive data in the UK by the Data Protection Act and cannot be shared. The primary care data can be requested via application to the Clinical Practice Research Datalink, with secondary care data and mortality data through linkage upon application. Information is available from <https://www.cprd.com/research-applications>.

Transparency Statement

Dr Andersen affirms that this manuscript is an honest, accurate, and transparent account of the study being reported; that no important aspects of the study have been omitted; and that any discrepancies from the study as planned (and, if relevant, registered) have been explained.

This study reports pre-specified analyses according to a registered protocol with CPRD (CPRD study number 22_002062) and Pfizer documented statistical analysis plan (study number KIMS 3106).

Role of the Funding Source

This study was funded by Pfizer Inc (grant number N/A).

Contributorship

Dr Andersen, Dr McGrath, Ms Reimbaeva, Dr Mendes, Dr Nguyen, Dr Tsang, Ms Malhotra and Dr Yang of Pfizer, as well as Dr Rai and Mr Tritton of Adelphi Real World which has received consulting fees from Pfizer, were involved in the study design (collection, analysis, and interpretation of the data), writing of the report, and in the decision to submit the article for publication. All authors had full access to all statistical reports and tables in the study and take responsibility for the integrity of the data and accuracy of the data analysis. All results presented in all tables were quality control verified by a non-Pfizer non-Adelphi employee.

Ethics Approval

CPRD obtains ethical research approval annually from the UK's Health Research Authority Research Ethics Committee to accumulate and distribute patient data. This study is based in part on data from the Clinical Practice Research Datalink obtained under license from the UK Medicines and Healthcare products Regulatory Agency. The data is provided by patients and collected by the NHS as part of their care and support. Office for National Statistics (ONS) and Hospital Episode Statistics (HES) data, copyright © (2021), re-used with the permission of The Health & Social Care Information Center. All rights reserved. The interpretation and conclusions contained in this study are those of the authors alone.

Files of "acceptable research quality", as defined by CPRD.	2,631,267
Continuously registered with CPRD GP practice for at least 365 days prior to COVID diagnosis, and did not have a registration end date, practice last collection date or death date prior to COVID diagnosis.	2,322,875
Hospital Episode Statistics (HES) Admitted Patient Care (APC) linkage eligible.	2,289,708
Once ONS data were received, 42 persons were noted that should have been excluded from the final cohort because ONS death data preceded index date.	2,289,666
Excluded persons who were admitted to the hospital on or before their primary care recorded date of COVID diagnosis. Due to mandatory GP reporting guidelines, this may be lagged from the date of true test collection and therefore not accurately reflect date of diagnosis.	2,271,072

All CPRD Aurum patients refers figures published in "Data resource profile: Clinical Practice Research Datalink (CPRD) Aurum" by Wolf et al (International Journal of Epidemiology 2019). We were unable to find more recent distributions by ONS region of all CPRD Aurum patients.

For all COVID cases, coronavirus.data.gov.uk no longer publishes case counts by region at the day level. It was not possible to limit to the study period of August 1, 2020 – January 31, 2022, and therefore the results above reflect the figures as accessed on January 31, 2023 of the total number of cases since the start of the pandemic.

For the population of England, we used ONS 2021 Census figures.

42 Description of sheet abbreviations:

43 hsa_ to reflect UK Health Security Agency clinical risk criteria code list

44 _XX_ to reflect the concept

45 __m to reflect medcodeid, _icd to reflect ICD-10 codes, _p to reflect procodeid or _opcs to reflect OPCS proc

46
47
48 Format of sheets:

49 medcodeid and procodeid are stored as text, not integers, as per CPRD suggestions.

ICD-10 code	Term
F72.0	Severe mental retardation with the statement of no, or minimal, impairment of behaviour
F72.1	Severe mental retardation significant impairment of behaviour requiring attention or treatment
F72.8	Severe mental retardation other impairments of behaviour
F72.9	Severe mental retardation without mention of impairment of behaviour
F73.0	Profound mental retardation with the statement of no, or minimal, impairment of behaviour
F73.1	Profound mental retardation significant impairment of behaviour requiring attention or treatment
F73.8	Profound mental retardation other impairments of behaviour
F73.9	Profound mental retardation without mention of impairment of behaviour
F78.1	Other mental retardation significant impairment of behaviour requiring attention or treatment
F80.3	Acquired aphasia with epilepsy [Landau-Kleffner]
F84.2	Rett syndrome
F84.3	Other childhood disintegrative disorder
Q90.0	Trisomy 21, meiotic nondisjunction
Q90.1	Trisomy 21, mosaicism (mitotic nondisjunction)
Q90.2	Trisomy 21, translocation
Q90.9	Down syndrome, unspecified
Q91.0	Trisomy 18, meiotic nondisjunction
Q91.1	Trisomy 18, mosaicism (mitotic nondisjunction)
Q91.2	Trisomy 18, translocation
Q91.3	Edwards syndrome, unspecified
Q91.4	Trisomy 13, meiotic nondisjunction
Q91.5	Trisomy 13, mosaicism (mitotic nondisjunction)
Q91.6	Trisomy 13, translocation
Q91.7	Patau syndrome, unspecified
Q92.0	Whole chromosome trisomy, meiotic nondisjunction
Q92.1	Whole chromosome trisomy, mosaicism (mitotic nondisjunction)
Q92.2	Major partial trisomy
Q92.3	Minor partial trisomy
Q92.7	Triploidy and polyploidy
Q92.8	Other specified trisomies and partial trisomies of autosomes
Q92.9	Trisomy and partial trisomy of autosomes, unspecified
Q93.3	Deletion of short arm of chromosome 4
Q93.4	Deletion of short arm of chromosome 5
Q93.5	Other deletions of part of a chromosome
Q93.6	Deletions seen only at prometaphase
Q93.7	Deletions with other complex rearrangements
Q93.8	Other deletions from the autosomes
Q93.9	Deletion from autosomes, unspecified
Q95.2	Balanced autosomal rearrangement in abnormal individual
Q95.3	Balanced sex/autosomal rearrangement in abnormal individual
Q90.0	Trisomy 21, meiotic nondisjunction
Q90.1	Trisomy 21, mosaicism (mitotic nondisjunction)
Q90.2	Trisomy 21, translocation
Q90.9	Down syndrome, unspecified
G35	Multiple sclerosis
G40.3	Generalized idiopathic epilepsy and epileptic syndromes
G40.4	Other generalized epilepsy and epileptic syndromes
G40.5	Special epileptic syndromes
G40.6	Grand mal seizures, unspecified (with or without petit mal)

1		
2	G40.7	Petit mal, unspecified, without grand mal seizures
3	G40.8	Other epilepsy
4	G40.9	Epilepsy, unspecified
5	G41.0	Grand mal status epilepticus
6	G41.1	Petit mal status epilepticus
7	G41.2	Complex partial status epilepticus
8	G41.8	Other status epilepticus
9	G41.9	Status epilepticus, unspecified
10	G46.3	Brain stem stroke syndrome
11	I63	Cerebral infarction
12	I63.0	Cerebral infarction due to thrombosis of precerebral arteries
13	I63.1	Cerebral infarction due to embolism of precerebral arteries
14	I63.2	Cerebral infarction due to unspecified occlusion or stenosis of precerebral arteries
15	I63.3	Cerebral infarction due to thrombosis of cerebral arteries
16	I63.4	Cerebral infarction due to embolism of cerebral arteries
17	I63.5	Cerebral infarction due to unspecified occlusion or stenosis of cerebral arteries
18	I63.6	Cerebral infarction due to cerebral venous thrombosis, nonpyogenic
19	I63.8	Other cerebral infarction
20	I63.9	Cerebral infarction, unspecified
21	I64	Stroke, not specified as haemorrhage or infarction
22	G30.0	Alzheimer disease with early onset
23	G30.1	Alzheimer disease with late onset
24	G30.8	Other Alzheimer disease
25	G30.9	Alzheimer disease, unspecified
26	F00.0	Dementia in Alzheimer disease with early onset
27	F00.1	Dementia in Alzheimer disease with late onset
28	F00.2	Dementia in Alzheimer disease, atypical or mixed type
29	F00.9	Dementia in Alzheimer disease, unspecified
30	F01.0	Vascular dementia of acute onset
31	F01.1	Multi-infarct dementia
32	F01.2	Subcortical vascular dementia
33	F01.3	Mixed cortical and subcortical vascular dementia
34	F01.8	Other vascular dementia
35	F01.9	Vascular dementia, unspecified
36	F02.0	Dementia in Pick disease
37	F02.1	Dementia in Creutzfeldt-Jakob disease
38	F02.2	Dementia in Huntington disease
39	F02.3	Dementia in Parkinson disease
40	F02.4	Dementia in human immunodeficiency virus [HIV] disease
41	F02.8	Dementia in other specified diseases classified elsewhere
42	F03	Unspecified dementia
43	F04	Organic amnesic syndrome, not induced by alcohol and other psychoactive substances
44	F05.0	Delirium not superimposed on dementia, so described
45	F05.1	Delirium superimposed on dementia
46	G12.2	Motor neuron disease
47	G12.20	Motor neuron disease - Unspecified
48	G12.21	Motor neuron disease - Amyotrophic lateral sclerosis
49	G12.22	Motor neuron disease - Progressive bulbar palsy
50	G12.23	Motor neuron disease - Primary lateral sclerosis
51	G12.24	Motor neuron disease - Familial motor neuron disease

1		
2	G12.25	Motor neuron disease - Progressive spinal muscle atrophy
3	G12.29	Motor neuron disease - Other motor neuron disease
4	G20	Parkinson Disease
5	G21.1	Other drug-induced secondary parkinsonism
6	G21.2	Secondary parkinsonism due to other external agents
7	G21.3	Postencephalitic parkinsonism
8	G21.4	Vascular parkinsonism
9	G21.8	Other secondary parkinsonism
10	G21.9	Secondary parkinsonism, unspecified
11	G80	Cerebral Palsy
12	G80.0	Spastic quadriplegic cerebral palsy
13	G80.1	Spastic diplegic cerebral palsy
14	G80.2	Spastic hemiplegic cerebral palsy
15	G80.3	Dyskinetic cerebral palsy
16	G80.4	Ataxic cerebral palsy
17	G80.8	Other cerebral palsy
18	G80.9	Cerebral palsy, unspecified

2 Inclusion criteria as in PANORAMIC protocol

3 Chronic respiratory disease (including chronic obstructive pulmonary disease (COPD), cystic fibrosis and
4 asthma requiring at least daily use of preventative and/or reliever medication)

5 Chronic heart or vascular diseases

6 Renal disease: mild kidney disease (CKD) stage 2 and 3, with an eGFR measurement in the past 6 months

7 Chronic liver disease

8 Chronic neurological disease (including dementia, stroke, epilepsy)

9 Severe and profound learning disability

10 Down's syndrome

11 Diabetes mellitus (Type I or Type II)

12 present at birth and diagnosed in childhood) or secondary due to disease or treatment (e.g., sickle cell, HIV,
13 cancer, chemotherapy)

14 Solid organ, bone marrow and stem cell transplant recipients

15 Morbid obesity (BMI > 35)

16 Severe mental illness

17 Community and care home resident

18 Description of sheet abbreviations:

19 pan_ to reflect PANORAMIC trial criteria code list

20 _XX_ to reflect the concept

21 __m to reflect medcodeid, _icd to reflect ICD-10 codes, _p to reflect procodeid or _opcs to reflect OPCS procodeid

22 Format of sheets:

23 medcodeid and procodeid are stored as text, not integers, as per CPRD suggestions.

ICD-10 code	Term
F72.0	Severe mental retardation with the statement of no, or minimal, impairment of behaviour
F72.1	Severe mental retardation significant impairment of behaviour requiring attention or treatment
F72.8	Severe mental retardation other impairments of behaviour
F72.9	Severe mental retardation without mention of impairment of behaviour
F73.0	Profound mental retardation with the statement of no, or minimal, impairment of behaviour
F73.1	Profound mental retardation significant impairment of behaviour requiring attention or treatment
F73.8	Profound mental retardation other impairments of behaviour
F73.9	Profound mental retardation without mention of impairment of behaviour
F78.1	Other mental retardation significant impairment of behaviour requiring attention or treatment
F80.3	Acquired aphasia with epilepsy [Landau-Kleffner]
F84.2	Rett syndrome
F84.3	Other childhood disintegrative disorder
Q90.0	Trisomy 21, meiotic nondisjunction
Q90.1	Trisomy 21, mosaicism (mitotic nondisjunction)
Q90.2	Trisomy 21, translocation
Q90.9	Down syndrome, unspecified
Q91.0	Trisomy 18, meiotic nondisjunction
Q91.1	Trisomy 18, mosaicism (mitotic nondisjunction)
Q91.2	Trisomy 18, translocation
Q91.3	Edwards syndrome, unspecified
Q91.4	Trisomy 13, meiotic nondisjunction
Q91.5	Trisomy 13, mosaicism (mitotic nondisjunction)
Q91.6	Trisomy 13, translocation
Q91.7	Patau syndrome, unspecified
Q92.0	Whole chromosome trisomy, meiotic nondisjunction
Q92.1	Whole chromosome trisomy, mosaicism (mitotic nondisjunction)
Q92.2	Major partial trisomy
Q92.3	Minor partial trisomy
Q92.7	Triploidy and polyploidy
Q92.8	Other specified trisomies and partial trisomies of autosomes
Q92.9	Trisomy and partial trisomy of autosomes, unspecified
Q93.3	Deletion of short arm of chromosome 4
Q93.4	Deletion of short arm of chromosome 5
Q93.5	Other deletions of part of a chromosome
Q93.6	Deletions seen only at prometaphase
Q93.7	Deletions with other complex rearrangements
Q93.8	Other deletions from the autosomes
Q93.9	Deletion from autosomes, unspecified
Q95.2	Balanced autosomal rearrangement in abnormal individual
Q95.3	Balanced sex/autosomal rearrangement in abnormal individual

ABSTRACT (347/400 words)

Objective: To create case definitions for confirmed COVID-19 diagnoses, COVID-19 vaccination status, and three separate definitions of high risk of severe COVID-19, as well as to assess whether the implementation of these definitions in a cohort reflected the sociodemographic and clinical characteristics of COVID-19 epidemiology in England.

Design: Retrospective cohort study

Setting: Electronic healthcare records from primary care (Clinical Practice Research Datalink, or CPRD) linked to secondary care data (Hospital Episode Statistics, or HES) data covering 24% of the population in England

Participants: 2,271,072 persons aged 1 year and older diagnosed with COVID-19 in CPRD Aurum between August 1, 2020 through January 31, 2022.

Main Outcome Measures: Age, sex, and regional distribution of COVID-19 cases and COVID-19 vaccine doses received prior to diagnosis were assessed separately for the cohorts of cases identified in primary care and those hospitalized for COVID-19 (primary diagnosis code of ICD-10 U07.1 "COVID-19"). Smoking status, body mass index and Charlson Comorbidity Index were compared for the two cohorts, as well as for three separate definitions of high risk of severe disease used in the United Kingdom (NHS Highest Risk, PANORAMIC trial eligibility, UK Health Security Agency Clinical Risk prioritization for vaccination).

Results: Compared to national estimates, CPRD case estimates underrepresented older adults in both the primary care (age 65-84: 6% in CPRD vs 9% nationally) and hospitalized (31% vs 40%) cohorts, and overrepresented people living in regions with the highest median wealth areas of England (20% primary care and 20% hospital admitted cases in South East, vs 15% nationally). The majority of non-hospitalized cases and all hospitalized cases had not completed primary series vaccination. In primary care, persons meeting high risk definitions were older, more often smokers, overweight or obese, and had higher Charlson Comorbidity Index score.

Conclusions: CPRD primary care data is a robust real-world data source and can be used for some COVID-19 research questions, however limitations of the data availability should be carefully considered. Included in this publication are supplemental files for a

total of over 28,000 codes to define each of three definitions of high risk of severe disease.

STRENGTHS AND LIMITATIONS OF THIS STUDY

- This study used the Clinical Practice Research Datalink (CPRD), a longitudinal and anonymized EHR database of primary health care interactions in England.
- Definitions were built using reproducible methods with independent local clinician review.
- Results were compared to government published COVID-19 case and vaccination counts to evaluate external validity of this data source.
- Limitations of the data include data recency lag, with primary care data ending in April 2022 and hospitalization data ending in March 2021.
- Owing to the primary care setting of the data, this study does not represent people without a general practitioner, or those who presented directly to hospital without a prior COVID-19-related primary care encounter.

INTRODUCTION

As of 3 February 2023, there have been over 20 million confirmed COVID-19 cases and more than 183,000 related deaths in England.[1] COVID-19 severity ranges from asymptomatic cases to severe disease requiring hospital admission and sometimes death, with older adults and people with chronic health conditions at disproportionate risk.[2,3] Therefore, electronic health records (EHR) with longstanding capture of patients' medical history are uniquely positioned to answer population-based questions related to healthcare resource utilization, economic impact, and pharmaceutical intervention associated with COVID-19.

The Clinical Practice Research Datalink (CPRD) is a longitudinal and anonymized EHR database of primary health care interactions in England.[4] Primary care is the cornerstone of healthcare in England, with over 98% of the population registered with a general practitioner (GP). From August 2020 through March 2022, all tests booked via the National Health Service (NHS) website for polymerase chain reaction (PCR) tests for SARS-CoV-2, regardless of result, were reported to GP offices that use the EMIS electronic health record software.[5] Similarly, COVID-19 vaccines administered at any location in the country were also mandated to be reported to patient's GP.[6] Thus, during this period, CPRD can be considered a closed network of confirmed COVID-19 cases for persons in the network, with accurate information on COVID-19 vaccination status.

While the CPRD has been used in over 3,000 peer-reviewed publications, it is not known whether interruptions in healthcare, particularly in-person primary care visits, during the first years of the coronavirus pandemic affected the previously described characteristics of the CPRD population. The objective of this study was to create case definitions for COVID-19 diagnoses, COVID-19 vaccination, and three separate definitions of high risk of severe COVID-19. Second, we aimed to evaluate these definitions in a sample of persons with COVID-19, using the CPRD, to assess whether this cohort's sociodemographic and clinical characteristics were generalizable to

8 **METHODS**

9 **Study Setting and Population**

10 CPRD Aurum contains data which is routinely collected from primary care practices that
11 use the EMIS Web® digital clinical system that includes electronic patient records.[7]
12 The May 2022 release of CPRD Aurum contained data from approximately 24% of
13 persons in England.[8,9] Data captured include age, sex, body weight, medical
14 diagnoses, referrals to specialists and/or secondary care, prescriptions issued in
15 primary care, laboratory tests, vaccinations administered, smoking and alcohol
16 consumption status, and all other types of care delivered as part of routine primary care
17 practice.

27 CPRD Aurum was linked to Hospital Episode Statistics Admitted Patient Care (HES
28 APC) records, using deterministic patient-level linkage with an 8-stage algorithm carried
29 out by NHS Digital. Over 99% of practices contributing to CPRD Aurum participate in
30 HES linkage. The HES APC dataset includes patient demographics, date and method of
31 hospital admission and discharge, diagnoses, specialty care, and procedures. HES
32 APC data from April 1997 to March 2021 was available in this study.

40 **Inclusion and Exclusion Criteria**

41 We included persons of any age diagnosed with COVID-19 (described below) from 1
42 August 2020 through 31 January 2022. First, we required records to be of acceptable
43 research quality, as defined by CPRD. Second, we required people to be continuously
44 registered with their GP practice for at least 365 days prior to COVID-19 diagnosis, to
45 establish pre-COVID-19 health history. Third, we required persons to be HES APC
46 linkage eligible to ensure the exclusion of patients where confirmed hospital admission
47 status (via HES APC, during the time period available) could not be known. Fourth, we
48 excluded persons who were admitted to the hospital with a primary diagnosis of U07.1
49 on or before their primary care recorded date of COVID-19 diagnosis. Due to mandatory

3 reporting guidelines, the GP's date of notification from the hospital may be delayed from
4 the date of true test collection and therefore may not accurately reflect date of
5 diagnosis. Lastly, we excluded persons with a registration end date, practice last
6 collection date or death date that was prior to their COVID-19 diagnosis.

10 11 12 **COVID-19 Case Definition**

13 With each monthly data release, CPRD publishes feasibility counts for SARS-CoV-2
14 related codes in CPRD primary care data with corresponding code lists.[8,10] The code
15 types include vaccination, tests (including PCR, antibody and antigen tests), diagnosis,
16 advice, possible cases, and post-COVID-19 clinic referral codes. Three reviewers (KA,
17 QM, AS) independently screened the CPRD code list to determine which of the codes
18 represented a confirmed and current infection. Discrepancies were adjudicated by a
19 fourth reviewer (LM), and the final definition for the COVID-19 case definition was
20 reviewed by UK and non-UK clinicians (**Supplemental file 1, Table 1**). We defined a
21 current and confirmed COVID-19 episode as a diagnosis code, positive PCR, or antigen
22 test. We did not include COVID-19 vaccination, antibody tests, possible cases,
23 exposure to COVID-19 or post-COVID-19 clinic referral codes in the COVID-19 case
24 definition.

36 Hospitalizations for COVID-19 were defined as persons admitted with a primary
37 diagnosis of COVID-19 (ICD-10 U07.1 "COVID-19") within 12 weeks of the initial
38 diagnosis recorded in primary care. Non-hospitalized COVID-19 cases were defined as
39 the subset of persons for whom secondary care data were available but had no record
40 of hospital admission. Primary care COVID-19 cases were defined as persons who
41 were not admitted to the hospital within 12 weeks of diagnosis, and those after April 1,
42 2021 for which hospital admission data were not available.

53 The first COVID-19 vaccine dose in England was administered on 8 December 2020,
54 with the initially limited supply prioritized for groups as outlined by the Joint Committee
55 for Vaccinations and Immunisations (JCVI).[11] In England, COVID-19 vaccines

3 produced by Pfizer-BioNTech and Moderna have been available since December 2020.
4 In April 2021, JCVI announced that persons who received a first dose of an
5 AstraZeneca vaccine would receive a second dose of the same brand but persons who
6 had not yet received a vaccine dose would be “preferentially offered an alternative”.^[12]
7 This study did not consider Novavax vaccinations, as it was approved for use after our
8 index date, or the Janssen or Valneva vaccines, which have not been used in England
9 as of February 2023.^[13]

17 In Phase 1 (December 2020 - March 2021), people aged 50 and older, as well as front-
18 line health and social care workers, clinically extremely vulnerable persons and persons
19 aged 16 and older with underlying health conditions were eligible to receive two doses.
20 In Phase 2 (beginning April 2021), access broadened for persons aged 18-49 to receive
21 two doses. Additionally, immunocompromised persons who received two doses in
22 phase 1 were recommended to receive a third dose at least eight weeks after their
23 second dose in order to complete their primary series. Phase 3 included a single dose
24 for 16–17-year-olds in August 2021. In September 2021, 12–15-year-olds could receive
25 a single dose and a booster dose for adults was recommended at least 6 months after
26 the completion of a primary series. In November 2021, 12–17-year-olds could receive a
27 second dose, and the recommendation for booster dose was shortened to at least 3
28 months after the completion of a primary series.^[11]

39 We used a combination of product codes, which specify brand and dose of vaccine, as
40 well as medical codes which indicated administration of a non-specific COVID-19
41 vaccine (**Supplemental file 1, Table 2**). The code lists were derived from the published
42 set by CPRD.^[10] While patients may have multiple vaccination codes in their record on
43 a given day, such as a code to indicate both the administration as well as a separate
44 code for the specific product given, persons were not counted as receiving as more than
45 one vaccine dose per day.

3 Persons were considered unvaccinated if there was no record of COVID-19 vaccination,
4 or for up to 13 days after first dose to account for time needed to build immunity
5 following immunisation. Dose 1 was defined starting 14 days after the record of the first
6 COVID-19 vaccine administration until 13 days after the receipt of second dose, or until
7 end of follow-up. Dose 2 was defined starting 14 days after the record of the second
8 COVID-19 vaccine administration and administered at least 21 days after the first dose.
9 Persons were considered to have had 2 doses until 13 days before their next vaccine.
10 For non-immunocompromised persons, the primary vaccination series was complete 14
11 days after second dose. For immunocompromised persons only, dose 3 was part of
12 their primary series at least 21 days after their second dose. First booster doses (winter
13 2021) were defined 21 or more days after the receipt of the last dose in primary series.
14 For all vaccination definitions, no upper limit on time between doses was applied.

26 **COVID-19 Risk Status**

27 We considered three separate definitions of COVID-19 risk status, each of which are set
28 forth by different groups and capture non-intersecting populations. First, the NHS
29 highest risk group, which was a list of conditions set forth by an advisory group
30 commissioned by England's Deputy Chief Medical Officer to identify persons at the very
31 highest risk of COVID-19 hospital admission and death.[14] Second, eligibility for the
32 PANORAMIC study, which began in December 2021 and is a platform randomized trial
33 of antiviral therapeutic agents.[15] The persons who qualify for antiviral treatment in the
34 trial are those at a higher risk of hospital admission and death. Third, UK Health
35 Security Agency (UKHSA) clinical risk groups as outlined in "The Green Book" chapter
36 14a, which is COVID-19 vaccination prioritization from the JCVI.[16] For each of these
37 three risk definitions, we operationalized the clinical conditions lists into SNOMED and
38 ICD-10 code lists. Where available, we used published code lists.[17–23] For concepts
39 not found in the literature, we developed wildcard-based search terms in the CPRD
40 code browser (**Supplemental file 1, Tables 3-5**). At least one practicing clinician from
41 the UK, who were independent and external to Pfizer, reviewed each of the search term
42 strategies, as well as ensuing code lists.

Comparison to Publicly Available Data

We compared our results to estimates published on the UK Government's Coronavirus dashboard, and restricted results to those specific to England, as the CPRD Aurum population that is HES-linkage eligible contains data from England only.[24,25] The data in this manuscript reflect figures from the dashboard as accessed on 31 January 2023. Where possible, we restricted the dashboard to cases from 1 August 2020 through 31 January 2022 to reflect the study period, although age, sex and region-specific estimates were reported "since the start of the pandemic".[24,25] For whole country (non-COVID-19 related) comparisons, we used the Office of National Statistics' 2021 Census.[9]

Statistical Analyses

All results are presented separately for the cohorts of persons with primary care versus hospitalized COVID-19 cases. Continuous variables are presented as means (standard deviations) or medians (interquartile ranges) and categorical variables as counts (percentages). Missing data for sex, region, smoking status and BMI is shown in tables. The absence of codes for comorbidities was assumed to be the absence of the comorbidity rather than missing data. Standardized mean differences (SMD) were used to compare groups, with SMD > 10% indicating significant difference. As per CPRD privacy rules, any cell with 10 persons or fewer (but not zero) was suppressed and other cells related to the small cell count were redacted to ensure no back-calculation could populate the count.

Data management and analyses for this study used SAS, version 9.4 (SAS Institute, Cary, North Carolina).

Patient and Public Involvement

RESULTS

1
2
3 From 1 August 2020 through 31 January 2022, the UK Government's Coronavirus
4 dashboard reported 14,744,991 COVID-19 cases in England.[24] The final CPRD
5 cohort contained 2,271,072 persons diagnosed with COVID-19, regardless of care
6 setting, in England in the same time period (**Supplemental file 1, Table 6**). The case
7 trends followed national estimates, with a series of peaks and troughs with a large peak
8 in winter 2021 (**Supplemental file 1, Figures 1 and 2**). Hospital admissions increased
9 in fall 2020 and winter 2020 (**Supplemental file 1, Figure 3**).

10
11
12
13
14
15
16
17 There were 2,257,907 persons with COVID-19 cases observed in primary care, which
18 included persons who were not hospitalized during the period of time for which hospital
19 admission data was available (n=522,288) as well as all COVID-19 diagnoses recorded
20 in the period where hospital admission data ended (n=1,735,619). Separately, there
21 were 13,165 persons (2% of COVID-19 cases from August 2020 to March 2021) who
22 were hospitalized within 12 weeks of initial COVID-19 diagnosis with a primary
23 diagnosis of COVID-19 (**Figure 1**).

30 31 **Characteristics of COVID-19 Cases**

32 For both primary care and hospitalized cases, the majority of persons with COVID-19 in
33 CPRD were adults aged 18-64 (**Table 1**). The age distribution of CPRD primary care
34 cases generally followed the national case count distribution, with young and middle-
35 aged adults representing the largest groups, as well as the largest fraction of the
36 English population (**Supplemental file 1, Table 7**). Older adults were underrepresented
37 in both cohorts as compared to national population estimates. Within the primary care
38 cohort, 6% of patients were aged 65-84 years, whereas 9% of national COVID-19 cases
39 occurred in this age group. Notable differences were observed in the hospitalized cohort
40 when compared to the national estimates; 31% vs. 40% were aged 65 - 84 years, and
41 8% vs. 21% aged ≥ 85 years, respectively.

42

44
45
46
47
48
49
50
51 The sex distribution of COVID-19 cases in the primary care cohort was comparable to
52 national estimates, with 55% female in each (**Table 1 and Supplemental file 1, Table**

1
2
3 **7)**. There were more males (57%) than females in the hospitalized cohort; there are no
4 national sex-specific hospital admission counts available.
5
6
7

8 The regional distributions of the CPRD primary care and hospitalized cohorts were
9 similar to each other, but not the overall country. Both of the study cohorts had larger
10 proportions of persons with GP practices in higher income regions of England as
11 compared to national case counts.[26] For example, 20% of persons in the primary care
12 cohort and 20% in the hospitalized cohort lived in South East region of England, the
13 region with the highest median total household wealth as reported in March 2020. This
14 is compared to 20% of CPRD contributing practices, 15% of all English cases and 16%
15 of the population lived in London (**Supplemental file 1, Table 8**). Similar trends are
16 seen with lower median total household wealth regions being proportionally
17 underrepresented in the COVID-19 CPRD cohort as compared to national case
18 estimates or population distribution.

29 **COVID-19 Vaccination Status**

30 At the time of COVID-19 diagnosis, 27% of non-immunocompromised persons and 36%
31 of immunocompromised persons had completed a primary series of COVID-19
32 vaccination (**Table 2**). Among the non-immunocompromised hospitalized COVID-19
33 cases, 98% were unvaccinated and none had completed a primary series. For
34 immunocompromised hospitalized COVID-19 cases, 56% were unvaccinated, 44% had
35 received one dose, and none had completed a primary series. As of 1 December 2021,
36 86% of adults had ≥ 1 and 80% had ≥ 2 COVID-19 vaccine doses (2% and 0.2% lower
37 than official reports, respectively).

46 **Populations at Risk of Severe Disease**

47 After wildcard searches, clinicians reviewed nearly 50,000 codes to set the definitions
48 for high-risk lists. The final lists contained 12,390 codes for NHS Highest Risk, 9,132
49 codes for PANORAMIC trial criteria and 7,343 codes for UKHSA Clinical Risk (**code
50 lists available upon reasonable request**). In the primary care cohort, 11% met NHS
51 Highest Risk, 31% PANORAMIC, and 10% UKHSA Clinical Risk criteria (**Table 3**). With

3 each definition, primary care cohort cases at high risk were more often current smokers
4 (ranging from 17-21% vs 13% in full cohort) or former smokers (24-28% vs 13%),
5 overweight (16-19%, vs 9%) or obese (20-28%, vs 10%), and a larger proportion had at
6 least 1 comorbidity in the Charlson Index (29-54%, vs 11%), where this was recorded.
7
8 Primary care cases at high risk of severe disease were also older (mean age 49-55
9 years, vs 34 years), more often female (55-63%, vs 54%), and had more recorded
10 vaccine doses prior to COVID-19 diagnosis (**Supplemental file 1, Table 9**).

11
12
13
14
15
16
17 Among hospitalized COVID-19 cases, 33% met NHS Highest Risk, 84% PANORAMIC,
18 and 41% UKHSA Clinical Risk criteria's (**Table 4**). The high risk hospitalized groups
19 were similar to the overall hospitalized cohort. Nearly half of persons were current
20 smokers (13-16%, vs 13%) or former smokers (32-39%, vs 29%), and more than half
21 were overweight (20-23%, vs 18%) or obese (37-42%, vs 35%). Among the hospital
22 admitted cohort, people meeting each high-risk definition were older (mean age 65-66
23 years, vs 60 years) (**Supplemental file 1, Table 10**). Subgroups of patients with the
24 NHS and UKHSA definitions had higher mean Charlson Comorbidity Indexes, and more
25 females, than high risk patients identified with the PANORAMIC criteria or the entire
26 hospitalized population.

36 DISCUSSION

37 Key Results

38
39 In this work, we defined and benchmark results from three key variables related to
40 COVID-19 research using CPRD: index COVID-19 diagnoses, COVID-19 vaccinations,
41 and persons at high risk of severe disease.
42
43
44
45
46
47

48 We identified 2,271,072 COVID-19 cases in CPRD Aurum between 1 August 2020
49 through 31 January 2022. Younger age and lower socioeconomic deprivation have
50 been consistently associated with reductions in COVID-19 incidence and
51 severity.[27,28] These factors may explain why this CPRD cohort, which proportionally
52 underrepresented persons age 65 and older and overrepresented persons living in the
53
54

58

2
3 regions with higher median total household wealth, captured 15% of COVID-19 cases in
4 a database that covers 24% of persons in England. The requirement for an NHS
5 number in order for results to be shared may explain some of this attrition as well.
6
7 Future work using CPRD for COVID-19 research will need to consider these limitations
8
9 of under ascertainment of cases. Moving beyond this study's time period, the transition
10
11 to at home testing, as well as the end of free PCR testing for the general public on April
12
13 1, 2022, will need to be additionally considered.
14
15

16
17 This manuscript reports results from a case definition of confirmed and current infection.
18 We did not include codes for immunoglobulin titers, as measurable antibodies indicate a
19 resolved infection rather than date of onset. We did not include codes indicating a
20 sequela of prior infection, as these most often occur on a later date than index
21 diagnosis. We did not include codes indicating a test without a result, as people with a
22 negative test result should not be included in a COVID-19 case definition. Our results
23 therefore identified fewer cases, although with greater specificity, than other studies in
24 published literature that allow for such heterogeneity.[29]
25
26
27
28
29
30
31

32 COVID-19 vaccination events were well captured in the CPRD. This stands in stark
33 contrast to most administrative claims and EHR databases in the United States, where
34 less than 50% of COVID-19 vaccines are recorded in comparison to estimates provided
35 by the Centers for Disease Control and Prevention.[30,31] England's national
36 healthcare system, as well as the NHS data infrastructure to facilitate capture of
37 COVID-19-related events and longstanding structure of general practitioners as the
38 central node in a person's healthcare coordination, enabled the high coverage of
39 COVID-19 vaccination records. Researchers can be more confident with CPRD data
40 that the absence of a vaccination record indicates unvaccinated status than they
41 otherwise would be with most other real-world datasets, which is a critical consideration
42 for studies related to COVID-19 disease burden, vaccination, or treatments.
43
44
45
46
47
48
49
50
51

52
53 The proportion of persons who had completed primary series vaccination prior to
54 infection was low among primary care cases. Notably, among hospitalized cases, no
55
56
57
58
59
60

1
2
3 patients had completed a primary COVID-19 vaccination series. These findings may be
4 explained by several factors. First, the COVID-19 vaccine was first made available in
5 England on 8 December 2020, and initially second doses were given up to 12 weeks
6 later to maximize limited supply for as many people as possible. Therefore, the calendar
7 period under study allowed for most persons to have had a COVID-19 diagnosis in
8 periods at which “full vaccination” was not achievable. Second, it is possible that one
9 vaccine offered protection against severe illness.[32–34]
10
11
12
13
14
15
16

17 We operationalized a total of over 28,000 codes, from an initial set of nearly 50,000, for
18 three definitions of persons at risk of severe disease. We have made the search terms
19 available, for reproducibility, as well as the resulting code lists, for other research
20 groups to implement in their work. After the completion of this work, NHS Digital
21 published a code list for “Targeted Conditions”, which includes each element in the NHS
22 Highest Risk category. Among these, the NHS code list can be repurposed for 4 of the
23 14 conditions in PANORAMIC criteria and 3 of the 11 conditions in UKHSA Clinical
24 Risk. To our knowledge, we offer the first publication of code lists for capture of all
25 elements in the PANORAMIC criteria as well as UKHSA Clinical Risk criteria for these
26 high-risk definitions, which can now be readily used in datasets that contain CPRD
27 medical and product, ICD-10 and OPCS Classification of Interventions and Procedures
28 codes.

32
33
34

39 While there are similarities between the three definitions, differences do exist. In the
40 example of renal disease, NHS Highest Risk defines as chronic kidney disease stage 4
41 or 5, PANORAMIC trial criteria stipulate stage 2 or 3, and UKHSA Clinical Risk are for
42 stages 3-5. PANORAMIC trial eligibility capture persons with mild renal disease, as
43 some antiviral treatments are not approved for use in persons with severe renal
44 disease. However, UKHSA Clinical Risk prioritized vaccination access for persons at
45 highest risk of disease, which would include persons with more advanced renal disease.
46 Notably, persons who have renal disease as defined by PANORAMIC trial criteria by
47 definition do not have renal disease by NHS definition, and people in each of these may
48 (or may not) meet UKHSA prioritization. The choice of which high risk definition to

8 In the primary care cases, persons at high risk were older, more often smokers, had
9 larger body sizes, and higher Charlson Comorbidity Indices from the overall group of
10 primary care cases. Among hospitalized cases, the high-risk groups were similar to the
11 entire hospitalized group. These findings are consistent with existing understanding of
12 high-risk definitions, and perhaps provide reassurance that the code lists measure the
13 purported phenomenon.

20 The study periods in this report represent the most recent data available from CPRD as
21 of 3 February 2023. During the Autumn of 2022, the Aurum database experienced data
22 quality issues related to the EMIS data flows from legacy systems, and no primary care
23 data have been made available to researchers since the May 2022 release (data
24 through March 2022, with some early view of April 2022). Separately, HES secondary
25 care data have not been updated since March 2021, as NHS Digital has undergone a
26 change in the way they process and link data. COVID-19 remains a serious disease for
27 some people, and it is certain that some of the 1.7 million persons diagnosed with
28 COVID-19 after April 1, 2021 would have been later admitted for COVID-19, but we do
29 not have the hospital admission data to distinguish them from those whose cases were
30 managed entirely in the community setting. Throughout, we have used the term
31 “primary care records” as the combined groups of those known to be non-hospitalized
32 (cases where HES data were available, but the person was not hospitalized), as well as
33 those who we have GP encounters for but unknown eventual hospital admission status.
34 It is difficult to approximate the number of hospital admissions that would be expected
35 with full data availability. Carrying forward the 2% hospital admission incidence seen in
36 the early pandemic period may not be appropriate, given 2021 introduced periods of
37 increased (delta variant) and decreased (omicron variant) risk of hospital admission, as
38 well the uptake of COVID-19 vaccinations and antiviral treatments. Finally, the
39 population structure of this cohort outlined in this work further challenge the direct
40 application of national estimates to CPRD cohorts.

5 The present study does not capture persons not under GP care such as prisoners,
6 some residential homes, and persons without a place of residence. Additionally, CPRD
7 Aurum, when linked with HES data, reduces the population to persons registered at
8 eligible GP practices in England and therefore may not represent persons in other
9 countries in the UK, or countries outside the UK. This study does not include persons
10 who presented directly to hospital without any prior GP interaction. In particular, persons
11 with more severe disease such as older adults may require immediate hospital
12 admission before seeking primary care, which could explain some of the gaps in
13 representation we have reported. Given that CPRD is a primary care database, and the
14 limited time period of hospital data availability, we decided to design our study as an
15 initial cohort of persons with primary care records of COVID-19. Studies looking for
16 complete capture of all hospitalized COVID-19 patients might consider other data
17 sources.

29 **CONCLUSION**

30
31 In conclusion, we present a cohort of over 2 million COVID-19 cases in linked CPRD-
32 HES data, using published definitions for COVID-19 cases, vaccinations, and each of
33 three UK-specific definitions of persons at increased risk of severe disease. CPRD
34 primary care data is a robust real-world data source and can be used for COVID-19
35 related research questions; however, limitations of the data availability should be
36 carefully considered.

All CPRD Aurum patients refers figures published in "Data resource profile: Clinical Practice Research Datalink (CPRD) Aurum" by Wolf et al (International Journal of Epidemiology 2019). We were unable to find more recent distributions by ONS region of all CPRD Aurum patients.

For all COVID cases, coronavirus.data.gov.uk no longer publishes case counts by region at the day level. It was not possible to limit to the study period of August 1, 2020 – January 31, 2022, and therefore the results above reflect the figures as accessed on January 31, 2023 of the total number of cases since the start of the pandemic.

For the population of England, we used ONS 2021 Census figures.

STROBE Statement—Checklist of items that should be included in reports of *cohort studies*

Andersen et al (2023): Persons Diagnosed with COVID in England in the Clinical Practice Research Datalink (CPRD): A Cohort Description

	Item No	Recommendation	Page No
Title and abstract	1	(a) Indicate the study's design with a commonly used term in the title or the abstract	1
		(b) Provide in the abstract an informative and balanced summary of what was done and what was found	2-3
Introduction			
Background/rationale	2	Explain the scientific background and rationale for the investigation being reported	4
Objectives	3	State specific objectives, including any prespecified hypotheses	4
Methods			
Study design	4	Present key elements of study design early in the paper	5
Setting	5	Describe the setting, locations, and relevant dates, including periods of recruitment, exposure, follow-up, and data collection	5
Participants	6	(a) Give the eligibility criteria, and the sources and methods of selection of participants. Describe methods of follow-up	5
		(b) For matched studies, give matching criteria and number of exposed and unexposed	N/A
Variables	7	Clearly define all outcomes, exposures, predictors, potential confounders, and effect modifiers. Give diagnostic criteria, if applicable	6-9
Data sources/ measurement	8*	For each variable of interest, give sources of data and details of methods of assessment (measurement). Describe comparability of assessment methods if there is more than one group	6-9
Bias	9	Describe any efforts to address potential sources of bias	6-9
Study size	10	Explain how the study size was arrived at	5
Quantitative variables	11	Explain how quantitative variables were handled in the analyses. If applicable, describe which groupings were chosen and why	9
Statistical methods	12	(a) Describe all statistical methods, including those used to control for confounding	9
		(b) Describe any methods used to examine subgroups and interactions	9
		(c) Explain how missing data were addressed	7, 9
		(d) If applicable, explain how loss to follow-up was addressed	N/A
		(e) Describe any sensitivity analyses	N/A
Results			
Participants	13*	(a) Report numbers of individuals at each stage of study—eg numbers potentially eligible, examined for eligibility, confirmed eligible, included in the study, completing follow-up, and analysed	eTable 6
		(b) Give reasons for non-participation at each stage	eTable 6
		(c) Consider use of a flow diagram	eTable 6
Descriptive data	14*	(a) Give characteristics of study participants (eg demographic, clinical, social) and information on exposures and potential confounders	10-11
