A CytopHluorin imaging paradigm

pH calculation

$$pH_{Basal} = pKa - \log\left[\left(\frac{1 + 10^{pKa-7.4}}{\frac{F_{Basal}}{F_{Max}}}\right) - 1\right]$$

$$pH_{Oligo} = pKa - \log\left[\left(\frac{1 + 10^{pKa-7.4}}{\frac{F_{Oligo}}{F_{Max}}}\right) - 1\right]$$

$pKa = 7.1$ for *CytopHluorin*

B pH measured by CytopHluorin

C

pH correction of L/F

$L_1 \sim$ Luminescence under pH_1

$L_0 \sim$ Luminescence under pH_0

$$pH_1 = pKa - \log\left[\left(\frac{1 + 10^{pKa-pH_0}}{\frac{L_1}{L_0}}\right) - 1\right]$$

$$L_0 = L_1 * \left(\frac{1 + 10^{pKa-pH_1}}{1 + 10^{pKa-pH_0}}\right)$$

$pKa = 7.03$ for *SynATP*

eg. Convert L in KO+NAD⁺ Oligo group (average pH=6.892) to ctrl Oligo condition (average pH=7.113)

$$L_{(pH=7.113)} = L_{(pH=6.892)} * \left(\frac{1 + 10^{7.03-6.892}}{1 + 10^{7.03-7.113}}\right)$$
