**Figure S4.** Fluorescence intensity profiles related to Figure 5.

Fluorescence intensity profiles for the both forms of the bis-platinum complex (**DHP-Pt<sub>2</sub>** and **CPDO<sub>2</sub>-Pt<sub>2</sub>**, red) and the nuclear marker Hoechst 33342 (blue) in the cancer cell lines BT-549 and A-375 (right columns). The regions of the images which were analysed are shown with yellow arrows (left columns).

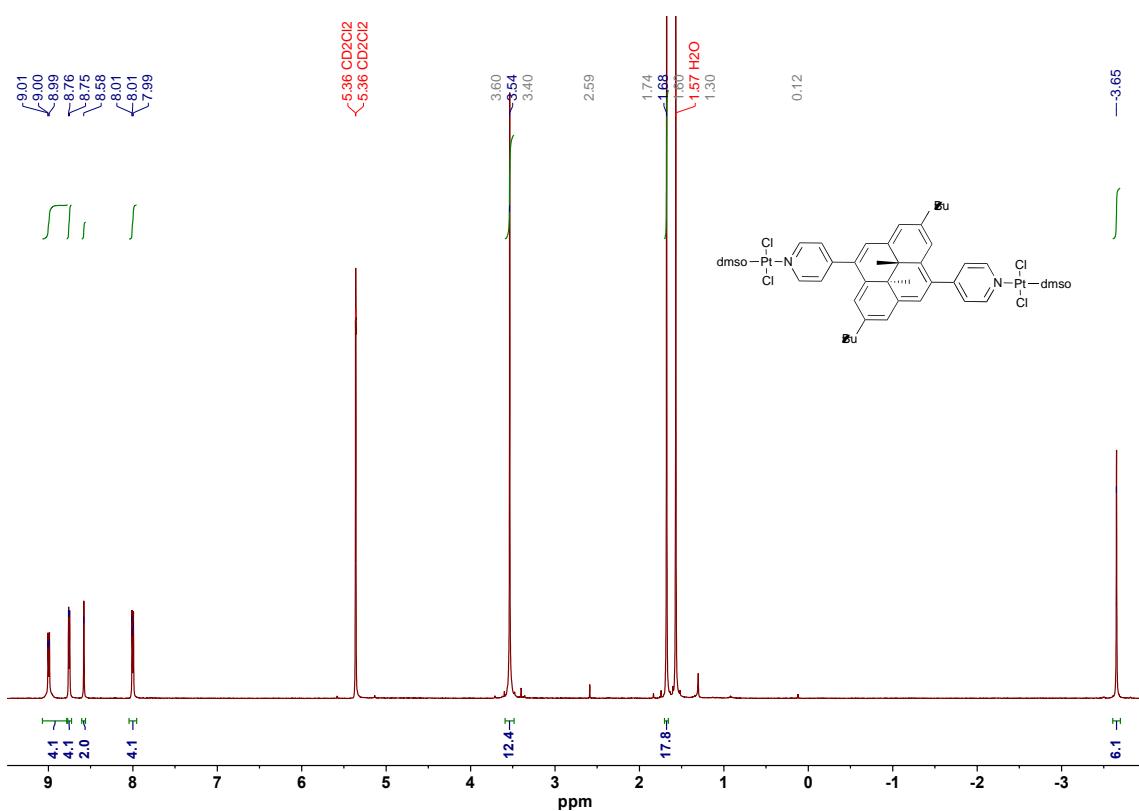

**Figure S5.** Thermal back isomerization of **CPDO<sub>2</sub>-Pt<sub>2</sub>** to **DHP-Pt<sub>2</sub>** and  $^1\text{O}_2$  release in tumorous cells related to Figure 6.

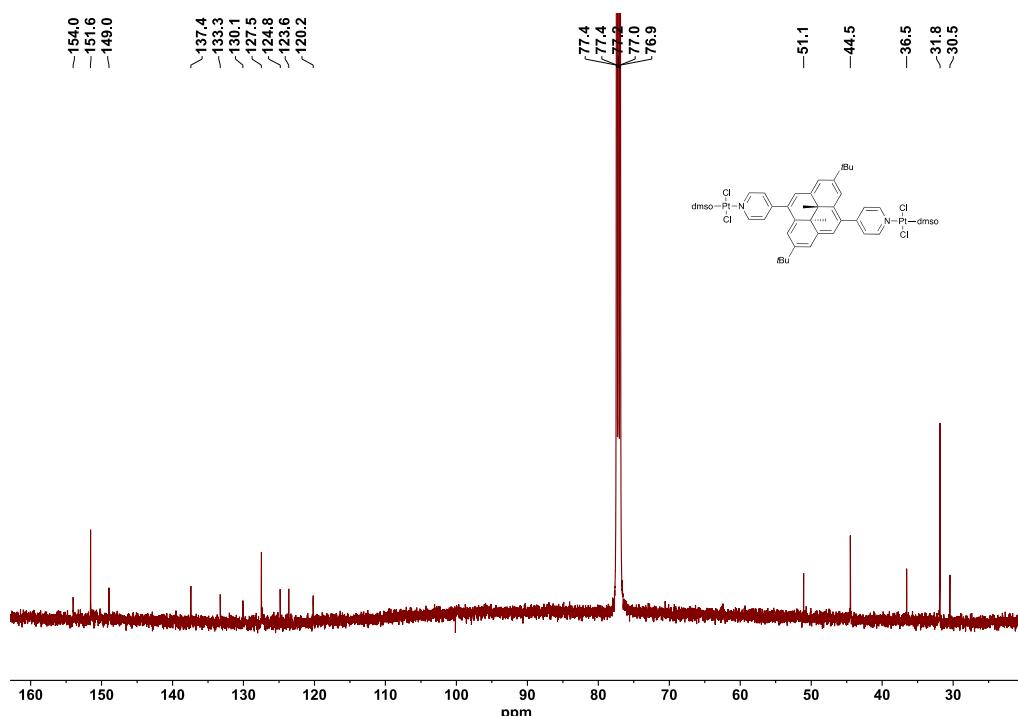

Confocal fluorescence microscope images of A-375 cells treated with 10  $\mu\text{M}$  of **CPDO<sub>2</sub>-Pt<sub>2</sub>** for 4h and 24h at 37°C. Imaging of  $^1\text{O}_2$  release from **CPDO<sub>2</sub>-Pt<sub>2</sub>** was followed using DCFH-DA as intracellular ROS probe. Scale bars are 20  $\mu\text{m}$ .

At 4h and 24h a significant DCF fluorescence (green) is observed indicating a  $^1\text{O}_2$  release from the **CPDO<sub>2</sub>-Pt<sub>2</sub>** complex in the tumorous cells. The fluorescence of the DCF observed is globally the same at 4h and 24h, indicating that the  $^1\text{O}_2$  release step is finished within 4h under our experimental conditions. The increase in **DHP-Pt<sub>2</sub>** fluorescence (in red) between microscopy images at 4 h and 24 h illustrates the thermal back isomerization (at T = 37°C) between the initially non-emissive **CPDO<sub>2</sub>-Pt<sub>2</sub>** form and the fluorescent **DHP-Pt<sub>2</sub>** form.
