

Supplementary Figure S1

Supplementary Figure S1. β -1,3-glucan exposure levels and growth of *C. albicans* clinical isolates. Levels of β -1,3-glucan exposure displayed by clinical isolates were quantified by Fc-dectin-1 staining and flow cytometry during exponential growth either on GYNB (normoxic control), in the presence of lactate, or under hypoxia. Their growth on GYNB was measured in separate experiments (doubling time in min). Means and standard deviations are shown for three independent replicates.
