

## **Supplementary Material**

### **Supplement to**

Phenotypic and genome-wide studies on dicarbonyls: major associations to glomerular filtration rate and gamma-glutamyltransferase activity

## Supplementary tables and figures – overview

### Supplementary figures:

#### Supplementary figure 1

Hierarchical clustering of dicarbonyl-associated traits.

#### Supplementary figure 2

Correlation plots of MG, GO, and 3-DG.

#### Supplementary figure 3

QQ-plots for GWAS of dicarbonyl metabolites controlled for intake and excretion.

### Supplementary tables:

#### Supplementary table 1

Retention times, MRM transitions, and inter batch variances.

#### Supplementary table 2

Available phenotypic traits in KORA.

#### Supplementary table 3

Results of phenotypic association study on dicarbonyls.

#### Supplementary table 4

Meta-analysis of lead traits.

#### Supplementary table 5

Stepwise conditional analysis.

#### Supplementary table 6

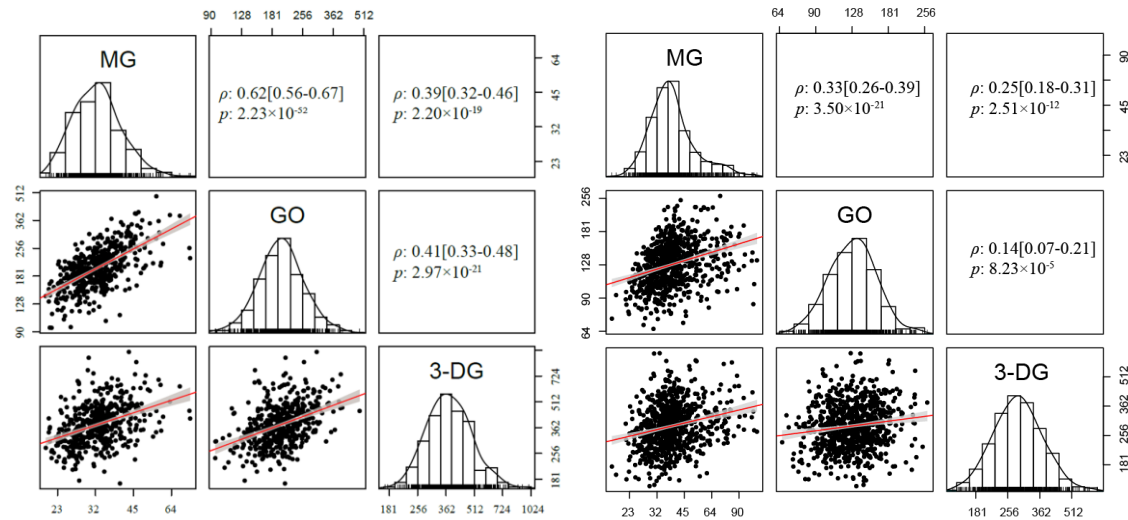

Association analyses of dicarbonyls with lead SNPs of GWA-studies on BMI, glucose, GFR, GGT, and systolic blood pressure.

## Supplementary figures:

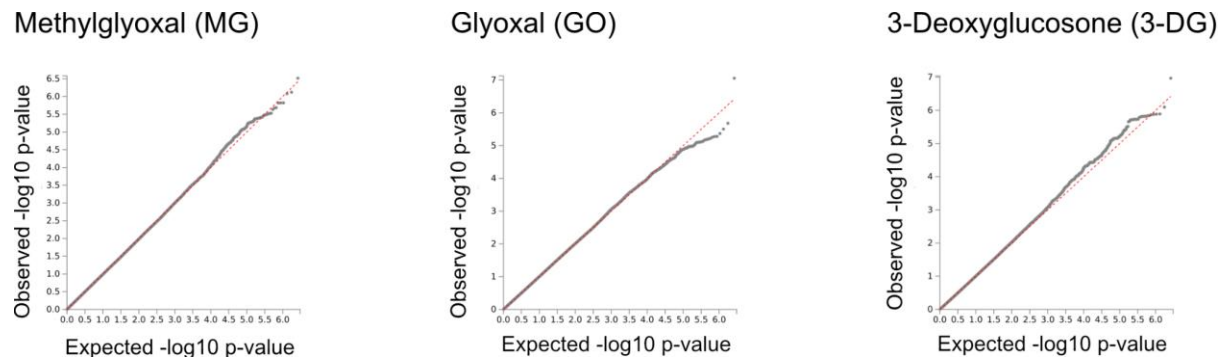

### Supplementary figure 1: Hierarchical clustering of dicarbonyl-associated traits.

To illustrate the correlation structure of the dicarbonyl-associated traits, hierarchical clustering of the binary and continuous traits was performed using Murtagh and Legendre's criterion, and Pearson's correlation-based distance. The heatmap displays Pearson's correlation coefficients. Expectedly, this clustering matched some of our categories (e.g., “glucose level”), while some traits clustered across categories according to their physiological (e.g., “iron metabolism/iron” with “inflammation/C-reactive protein”) or pharmacological relations (e.g., “cardiovascular system/hypertension” with “medication/taking antihypertensives”).

### Supplementary figure 2: Correlation plots of MG, GO, and 3-DG.

Correlation plots of the three metabolites in KORA (right panel) and BiDirect (left panel). The frequency distributions of the concentrations [nM] of methylglyoxal (MG), glyoxal (MG), and 3-deoxyglucosone (3DG), as displayed on the diagonal, were approximately lognormal (appearing Gaussian due to logarithmic scaling). The lower left triangle displays the scatter plots with regression lines (red) and 95% confidence intervals (gray shades). The upper triangle shows the Pearson correlation coefficients with [95% confidence intervals] and correlation significance.

### Supplementary figure 3: QQ-plots for GWAS of dicarbonyl metabolites controlled for intake and excretion.

QQ-plots of the GWAS of the different dicarbonyl metabolites controlled by BMI, age, sex, batch, PCA, GFR and glucose show no evidence of population stratification. They reflect the limited power of the study due to the small sample size.

## Supplementary tables:

### Supplementary table 1: Retention times, MRM transitions, and inter batch variances.

LC-MS/MS parameters of the measurements in KORA (\*) and BiDirect (\*\*).

Substance	Inter batch [CV%]	Retention time [min]	Precursor ion [m/z]	Fragment ion (quantifier/qualifier) [m/z]
3-Deoxyglucosone	25 (*)	5.9	239.13	161.1
	21 (**)			149.1
Glyoxal	15 (*)	6.9	135.09	81.06
	15 (**)			108.07
Methylglyoxal	12 (*)	7.4	149.1	81.06
	12 (**)			122.09

**Supplementary table 2: Available phenotypic traits in KORA.**

136 potentially relevant phenotypes were selected initially for the phenotypic association study in KORA.

Available phenotypic traits (KORA)	
Age at diagnosis of validated diabetes mellitus with type indication	Iron
Age Group	Kidney disease within last 12 month
Alcohol consumption	LDL - cholesterol
Alkaline phosphatase (ALP)	L-Dopa
Amount of cancers	Lithium
Angiotensin antagonists	Liver disease within last 12 month
Anticoagulants	Low potency neuroleptics
Anti-dementia medication	Medication taken in the last 7 days
Antidepressants	Metformin
Antidiabetic medication	Mirtazapine
Antiepileptic drugs	Muscle relaxants
Antihypertensives (Assignment according to recommendations of the German League)	Muscle relaxants, centrally acting agents
Anxiety or panic disorders within last 12 month	Neurological diseases (e.g. multiple sclerosis or Parkinson's disease) within the last 12 month
Atypical neuroleptics	Non-selective monoamine reuptake inhibitors
Average sleep duration in hours	Non-steroidal anti-inflammatory drugs
Benzodiazepines	Opioids (Analgesics )
Beta-blockers	Oral antidiabetics
Bisphosphonates	Oral contraceptives
Body Mass Index	Other antihypertensives (except diuretics, beta-blokers, ACE inhibitors, calcium and angiotensin antagonists)
Body Mass Index Categories according to WHO	Pack years
Calcium antagonists	Parkinson screening: Feeling that the feet are stuck to the floor (self-reported)
Chronotyp - sleep corrected	Parkinson screening: Has anyone told you that you have Parkinson's disease (self-reported)
Chronotyp - sleep, age and sex corrected	Parkinson screening: Less facial expression (self-reported)
Classification of work or main occupation	Parkinson screening: Problems getting up from a chair (self-reported)
Coronary heart disease	Parkinson screening: Quieter voice (self-reported)
Current hypertension (140/90 mmHg) or known hypertension controlled by medication (ISH-WHO 1999)	Parkinson screening: Smaller handwriting (self-reported)
Current physical condition (self-reported)	Parkinson screening: Trembling of arms and legs (self-reported)
Dementia screening: Difficult to plan or organise everyday life, e.g. shopping, hobbies, invitations or trips (self-reported)	Parkinson screening: Unsteady walking (self-reported)
Dementia screening: Difficulties following programmes on television/radio or content of newspaper/articles/books (self-reported)	Passive smoker
Dementia screening: Difficulties with your memory, e.g. remembering events of the day or content of conversations (self-reported)	Peripheral atherosclerosis
Dementia screening: Gradual start of symptoms (self-reported)	Phlebitis in superficial veins within last 12 months
Dementia screening: Problems carrying out familiar activities (self-reported)	Physical Activity in Categories
Depression(Depression module of the Brief Patient Health Questionnaire)	Previous heart operations
Diagnosed cancer	Proton pump inhibitors
Diagnosed hyperthyroidism	Pulse frequency
Diagnosed hypothyroidism	Regular systemic corticosteroid use
Diagnosed hypothyroidism	Selective monoamine reuptake inhibitors
Diagnosed nerve damage (neuropathy, polyneuropathy or diabetic foot) within last 12 months	Selective serotonin reuptake inhibitors
Diastolic blood pressure	Sex
Diuretics	Sleep inertia on free days
Dopamine agonists	Sleep latency on free days

Duration of cycling on weekdays (self-reported)	Smoking status
Elevated cholesterol or triglyceride levels within last 12 month	Statins
Examination date	Strong painkillers
Fasting serum glucose	Success rates of diets (self-reported)
Fasting status on the day of examination with regard to food	Systemic hormone therapy
Ferritin	Systolic blood pressure
Fibrates	Taking ACE inhibitors
Gamma-glutamyltransferase (GGT)	Thrombosis of the deep veins within last 12 month
Gastric or duodenal ulcer within last 12 month	Thyroid hormones
Gastritis within last 12 month	Thyrostatic drugs
Generalized Anxiety Disorder Scale	Time usually spend cycling on weekdays (self-reported)
Glomerular filtration rate (CKD-EPI 2009)	Time usually spend outdoors in summer (self-reported)
Glutamate pyruvate transaminase (GPT, ALT)	Time usually spend outdoors in winter (self-reported)
Glutamate receptor antagonists	Time usually spend walking on weekdays (self-reported)
Glutamic oxalate transaminase (GOT, AST)	Total - cholesterol
Gout, elevated uric acid levels within last 12 month	Total heart attacks
HbA1c value	Triglyceride-lowering medication
HDL - cholesterol	Triglycerides
Height	Trizyclika
High-potency neuroleptics	Trombocyte aggregation inhibitors
hs C-reactive protein	Validated diabetes mellitus with type indication
Hypertension classification (ISH-WHO 1999)	Waist hip ratio
Hyperuricemia medication	Weight
Inflammatory bowel disease within last 12 month	Weight loss diet within last 12 months
Inpatient treated myocardial infarction (self-reported)	Year of the 1st heart attack
Inpatient treated stroke (self-reported)	Year of the 1st stroke
Insulin	Zopiclone/zolpidem

**Supplementary table 3: Results of phenotypic association study on dicarbonyls (Supplement to Figure 1).**

136 potentially relevant phenotypes were selected initially for the PheWAS in KORA. 84 of these phenotypes passed the false discovery rate (FDR) threshold of 5% for at least one dicarbonyl compound and were therefore included in further analyses. Each phenotype was assigned to one of 21 categories ("Groups") according to general physiological and medical classifications. Aligned phenotypes (23 identical traits, 21 proxies) were available in the replication set (BiDirect) for 44 of the 84 phenotypes. In both cohorts the statistics were calculated for each dicarbonyl (MG, GO, 3-DG) separately as well as for all 3 dicarbonyls combined.

To optimize the discovery of (marginal) correlations between dicarbonyls and traits, continuous variables were transformed such as to maximize the explained variance ( $R^2$ ), i.e., log2-transformed ("log"), subjected to rank-based inverse normal transformation ("irn") or left untransformed ("raw"). Linear and multivariate linear models were used for regression of traits on single and multiple dicarbonyls, respectively, to calculate significance levels. The assumptions of the regression models were assessed by Shapiro–Wilk normality test of the residuals and the Cook–Weisburg test for heteroskedasticity. One round of outlier filtering was performed excluding residual outliers ( $p_{\text{Bonferroni}} < 0.05$ ) and data points with a Cook's distance  $> 4/N$ . If the regression assumptions were not met, the transformation type was adapted or, if the latter was unsuccessful, the significance of the Fisher-transformed Spearman rank correlation coefficient was determined. Similarly, the correlation with traits represented by binary, ordinal or nominal variables were analyzed without covariates by simple, ordinal, or multinomial logistic regression models, respectively. If the regression did not converge or outlier diagnostics were still not passed after the first round of outlier filtering, Kruskal-Wallis test was used instead.  $R^2$  and Nagelkerke's pseudo- $R^2$  were reported for linear and logistic models, respectively.

Group	Type	Detailed phenotype (KORA)	Aligned phenotype (BiDirect)	MG (KORA)					MG (BiDirect)

#### Supplementary table 4: Meta-analysis of lead traits.

A phenotype was considered to be a lead trait of a category if in KORA

i) the association of that trait reached Bonferroni-corrected significance for at least one of the 3 dicarbonyls (MG, GO, 3-DG)

and

ii) that association was more significant than the respective associations of other traits in that category.

12 of the 15 lead traits were available in both population samples (exactly or as a proxy) and could be included in the meta-analysis.

**Supplementary table 5: Stepwise conditional analysis of traits in KORA that passed the false discovery rate (FDR) threshold of 5% for at least one dicarbonyl compound (MG, GO, 3-DG).**

Stepwise conditional phenotypic association study of a dicarbonyl started with using the most significantly associated trait as a covariate in the repetition of the analyses of all other traits. The most significant trait in the repetition was then added as covariate for another round of analyses. This procedure was repeated until no further trait passed the Bonferroni-corrected significance threshold in the likelihood-ratio-test ( $P_{Lrtest} \leq 0.05/84$ ) anymore (of note, p-values usually do not represent the significance of an unconditioned analysis). Permutation p-values ( $P_{perm.}$ ) are calculated based on the simulated null distribution of the likelihood-ratio statistic, providing a robust reference for possible complex collinearity and data distribution in this study.

N indicates the number of traits that were conditioned on. If  $N=2$ , for instance, the analysis of the respective trait was conditioned on the trait with  $N=0$  and the trait with  $N=1$ .

**Supplementary table 6: Association analyses of dicarbonyls with lead SNPs of GWA-studies on BMI, glucose, GFR, GGT, and systolic blood pressure (SBP).**

2,385 leads SNPs of available previously published GWA studies on traits selected by RDA in both studies (Figures 2B and 2C) were selected for genotypic association analyses with the dicarbonyls MG, GO, and 3-DG. These analyses were done with an extended model that accounted for the dependency of the dicarbonyls on intake and excretion. One SNP (highlighted in green) overcame the Bonferroni-corrected significance threshold of  $0.05/1,890 = 2.65E-05$ . The effective number of 1,890 was used for correction because some SNPs were in linkage disequilibrium. Nominally significant results are shown ( $p < 0.05$ ).
