Methods

Terminology is used in accordance with IUPAC (International Union of Pure and Applied Chemistry) definitions stated in “Basic Terminology of Stereochemistry”.(1)

COMPILING EMA NEW DRUG APPROVALS DATA

The EMA “Human Medicines: highlights of (year)” reports were used to identify medicines which contained a NAS which were approved by the EMA in the years 2015 to 2022.(2) These reports provide the trade names of new medicines which have been approved each year and classify them according to their general therapeutic area. Those which contain a NAS are highlighted. No other information on the drug is provided. Based on these reports a list was compiled of the trade names of all medicines approved by the EMA in the period 2015-2022 which contained a NAS.

This list was then cross-referenced with a spreadsheet listing all medicine European Public Assessment Reports (EPARs) downloaded from the EMA website.(3) This spreadsheet provides significantly more detail than the highlights reports including medicine name, active substance(s), exact marketing authorisation date, use/indication etc. It does not, however, indicate which medicines contain active substances which have not previously been authorised thus necessitating the use of the “Human Medicines: highlights of (year)” reports.

The final stage in compiling the EMA data was classification of the NASs according to their chirality. The list of active substances was firstly filtered to remove the majority of biologics. This was achieved by removing drugs classed as vaccines then leveraging naming conventions used for biopharmaceuticals. NASs whose name contained the suffixes listed in

Table S1 were classified as biologics and not considered for further classification. Similarly, all vaccines were classed as biologics and not further classified.

The remaining medicines were then classified according to their chirality; chiral or achiral. Some additional biologics and non-biologic macromolecules were identified which were excluded from the chirality classification. Chiral molecules were further classified according to whether they are marketed as a single enantiomer or as a racemate. For simplicity, mixtures of diastereomers were classified as racemic drugs. Chiral drug molecules were also classified based on their type of chirality and, in the case of molecules containing one or more stereocentres, the number and stereocentre type. This was achieved by accessing the EPARs on the EMA website for each medicine. The Active Substance section of each report provides the structure of the active substance and details of the molecule’s chirality.

As the EMA “Human Medicines: highlights of (year)” reports were not published prior to 2015, an alternative approach was employed to the compilation of EMA data for years 2013 and 2014. The list of all medicines approved in those years from the Medicine EPAR spreadsheet was filtered to remove biologics. The EPARs for all remaining medicines were accessed on the EMA website. These reports were used to identify which active substances were NASs and also classify them according to their chirality as described above.

COMPILING FDA NEW DRUG APPROVALS DATA

Data on FDA NME drug approvals was collected from the FDA web page “New Drugs at FDA: CDER’s New Molecular Entities and New Therapeutic Biological Products”.(5) This site lists the trade names of all medicines approved by the FDA since 2015 that contain NMEs or NBEs. In addition, it provides the name of the new active substance, approval date and the medicine’s approved use. Biologics were filtered from the extracted list based on their nomenclature as described above (**Table S1**). The remaining medicines were cross-referenced with the EMA list such that the classifications of medicines also appearing in the EMA list could be transposed. In order to classify the remaining NMEs according to their chirality, their structures were obtained from PubChem, the website of the US National Library of Medicine.(6) The stereochemistry of each compound was confirmed using the Global Substance Registration System website.(7)

As data has previously been published by Modroiu and Hancu classifying FDA drug approvals from 2010-2020 based on their chirality, only new FDA drug approvals from 2020-2022 were analysed as part of the study.(8) 2020 was included in this analysis to confirm that the previously published data was replicated using the approach described here.

COMPILING CHIRAL SWITCH DATA

In order to identify new active substances that had been brought to market in the last ten years using the chiral switch approach, the naming conventions for chiral switch drugs was leveraged. The prefixes *es-* and *ar-* may be used where a racemate is chiral switched to the *S* or *R* enantiomer, respectively. Alternatively, the prefixes *dextro-* or *dex-* may be used for a chiral switch drug that displays dextrorotary optical activity or *levo-* or *lev-* where it displays levorotary optical activity.(9) The EPARs spreadsheet from the EMA website was filtered for the relevant time period (2013-2022).(3) Searches for the chiral switch prefixes were carried out within the filtered list. Each search result was examined to determine whether it was the result of chiral switch within the period of interest. Several active substances fulfilled the search criteria but were not the result of a chiral switch strategy e.g. artesunate, aripiprazole, estetrol monohydrate. Others were the result of chiral switching but had previously been marketed prior to 2013 e.g. esomeprazole, levofloxacin.

The same search procedure was applied to the compiled list of FDA drug approvals from 2020-2022. For the years 2013-2019, this search procedure was applied to the relevant lists of new drug approvals on the FDA web page “New Drugs at FDA: CDER’s New Molecular Entities and New Therapeutic Biological Products”.(5)

SEARCH STRATEGY LIMITATIONS

A limitation of this search strategy is that axial chirality arising from atropisomerism has the potential to be overlooked, specifically in the case of Class II atropisomers. Stable Class III atropisomers are expected to be clearly identified and Class I molecules are not considered chiral.
