

Supplementary Appendix

Supplementary Figure S1. Evolution of the gut microbiota and stool components in the 2 healthy volunteers with detectable levels of antibiotics in faeces.

For 'low dimensionality' systems, the log₁₀ fold changes from baseline are presented (except for variables relative to system's richness which were not transformed), whereas for 'high-dimensionality' systems we depicted the normalized distance from baseline. In each graph the x-axis indicates the time following antibiotic administration, whereas the y-axis corresponds to the change from baseline (positive and/or negative) with the unit in brackets. The two selected individual are represented by a blue and red line, respectively. The dotted lines correspond to the median of the remaining 20 subjects. Cholesterol conv. rate, Cholesterol conversion rate; BA, Bile acids.

Supplementary Table S1. Effect of the antibiotics on each of the studied components, according to the treatment group in the 22 healthy volunteers included in the CEREMI trial.

For ‘low dimensionality’ systems, the log₁₀ fold changes from baseline were used (except for variables relative to system’s richness which were not transformed), whereas for ‘high-dimensionality’ systems we used the normalized distance from baseline.

Baseline data were obtained from the day -1 sample. AUC D0D10 (respectively AUC D0D30) were normalized by the actual time observed between baseline and day 10 (respectively day 30). Data are presented as median (min; max). P-values refer to the result of non-parametric Wilcoxon test. Q-value corresponds to the test after Benjamini & Hochberg’s correction. P-values and Q-values in bold represent values below 0.05.

Supplementary Table S3. Spearman's correlations of the maximal perturbations of studied gut microbiota and stool components in the 22 healthy volunteers included in the CEREMI trial.

P-values corresponds to the uncorrected test of the Spearman's correlation coefficient to 0. Q-value corresponds to the test of the Spearman's correlation coefficient to 0 after Benjamini & Hochberg's correction. P-values and Q-values in bold represent values below 0.05. Conc., concentration; Cholesterol conv. rate, Cholesterol conversion rate; BA transf. Capacity, Bile acids transformation capacity.

Supplementary Table S6. Spearman's correlations between the baseline characteristics and the maximal resiliences of the studied gut microbiota and gut components in the 22 healthy volunteers included in the CEREMI trial.

P-values corresponds to the uncorrected test of the Spearman's correlation coefficient to 0. Q-value corresponds to the test of the Spearman's correlation coefficient to 0 after Benjamini & Hochberg's correction. P-values in bold represent values below 0.05. Conc., concentration; Cholesterol conv. rate, Cholesterol conversion rate; BA transf. Capacity, Bile acids transformation capacity.
