## INDEX OF SUPPLEMENTARY FIGURES

S1: Rest period for longitudinal magnetization recovery . . . . .	2
S2: Phantom $T_{1\rho, \text{adiab}}$ and $T_{1\rho}$ maps, average values and repeatability . . . . .	3
S3: Patients $T_{1\rho, \text{adiab}}$ maps: aSL preparations comparison . . . . .	4

## INDEX OF SUPPLEMENTARY TABLES

S1: Results healthy subjects cohort 1: $T_{1\rho, \text{adiab}}$ . . . . .	5
S2: Results healthy subjects cohort 1: precision, reproducibility and inter-subject variability. . . . .	5
S3: Results healthy subjects cohort 2: $T_{1\rho, \text{adiab}}$ and $T_{1\rho}$ . . . . .	5
S4: Results healthy subjects cohort 2: precision, reproducibility and inter-subject variability. . . . .	5

## Phantom experiments: $M_z$ recovery vs. $T_{1\rho, \text{adiab}}$

**FIGURE S1:** Phantom  $T_{1\rho, \text{adiab}}$  maps acquired with different rest periods for longitudinal magnetization recovery delays.  $T_{1\rho, \text{adiab}}$  values ( $\pm$  standard deviation) reported in the plot are measured from the normal myocardium-mimicking vial (left column, middle row). For longitudinal magnetization recovery delays  $\geq 3000\text{ms}$ , the measured  $T_{1\rho, \text{adiab}}$  values deviate less than 5% from the asymptotic value.

### A. Phantom $T_{1\rho}$ maps

### B. Average phantom $T_{1\rho}$ (10 repetitions)

### C. Repeatability (coefficient of variability)

**FIGURE S2:** (A) Example of  $T_{1\rho, \text{adiab}}$  and  $T_{1\rho}$  maps of the tissue-mimicking T1MES phantom. Good map quality was achieved with aSL preparations, whereas visible artifacts are apparent in most vials in the maps obtained with RefSL preparation. Approximate  $T_1$  and  $T_2$  maps are displayed for reference. (B)  $T_{1\rho, \text{adiab}}$  and  $T_{1\rho}$  values with standard deviation bars for each vial, averaged over 10 repetitions.  $T_{1\rho, \text{adiab}}$  values are consistently higher than  $T_{1\rho}$  values measured with RefSL preparations.  $T_{1\rho, \text{adiab}}$  dispersion is observed across  $B_0$ , Bal and  $B_1$  optimized pulses, due to a progressively lower  $\beta$  value. (C) Repeatability measured as the coefficient of variability ( $wCV_i$ ) for each vial. Averaging across all the vials, aSL preparations yielded significantly improved repeatability ( $wCV_i = 0.29 \pm 0.15$  for  $B_0$ -aSL,  $p < 0.01$ ;  $wCV_i = 0.23 \pm 0.13$  for Bal-aSL,  $p < 0.01$ ;  $wCV_i = 0.21 \pm 0.11$  for  $B_1$ -aSL,  $p < 0.001$  vs.  $wCV_i = 1.30 \pm 1.34$  for RefSL).

## A. Patient 1

## B. Patient 2

**FIGURE S3:**  $T_{1\rho, \text{adiab}}$  maps obtained with  $B_0\text{-aSL}$ ,  $Bal\text{-aSL}$  and  $B_1\text{-aSL}$  preparations. Image quality is compromised due to artifacts visible in the maps for  $B_0\text{-aSL}$  in (A) and for  $Bal\text{-aSL}$  in (B). Furthermore  $Bal\text{-aSL}$  prepared baseline images were subject to substantial residual motion in both patients, lowering the image quality.

**TABLE S1:** In-vivo myocardial  $T_{1\rho, \text{adiab}}$  values [ms], averaged over all repetitions and segments for 6 healthy volunteers of cohort 1.
